Preface

This volume is the latest in a series that presents descriptive statistical results from a national survey of young people entitled Monitoring the Future: A Continuing Study of the Lifestyles and Values of Youth. Each year, the study surveys a large sample of high school seniors, located in approximately 130 schools nationwide and drawn to be representative of all seniors in the coterminous United States.

The first four volumes in this series, dealing with the high school classes of 1975, 1976, 1977, and 1978, were published simultaneously early in 1980. Additional volumes appear on an annual basis. The most important contribution of this series is likely to be the opportunity it provides for the exploration of trends, a process that obviously involves the use of several different volumes. With that in mind, we have kept the format highly consistent from one volume to another, and we have developed an index (described below) that should facilitate the process of matching data across years. It should be noted that the volume presenting 1975 data is different from the others in several respects.*

Although we designed the volumes to fit together as a series, we also saw distinct advantages in having each volume able to stand alone—to be usable without reference to any of the others. For that reason, the introductory material on research design and questionnaire content, the instructions for accessing the data tables, and the appendices on sampling errors are all included in each volume. Thus, the small price we pay for making each volume self-contained is that much of the text portion is repeated each year.

Purposes of This Series of Publications

Monitoring the Future, which is conducted by the University of Michigan's Institute for Social Research and receives its core funding from the National Institute on Drug Abuse, is an unusually comprehensive research project in several respects: surveys are conducted annually on an ongoing basis; the samples are large and nationally representative; and the subject matter is very broad, encompassing some 1,400 variables per year. Many people—scholars, policy makers, educators, and so on—will have an interest in the results.

The principal investigators are already writing for a number of these audiences and will continue to do so. Because of the limitations in our own time, interests, and expertise, however, there is an enormous amount of valuable information that may never be utilized if the initiative to digest and disseminate all of it must come from us alone. Further, since the project is in part a social indicator series, its value rests to a considerable degree on *timely* dissemination of the results. For these reasons, we wish to share the study's results with others in a number of fields on a rapid and regular basis. We have chosen to provide two major and complementary vehicles for doing this: (a) these annual reference volumes of descriptive results and (b) machine-readable data archives for direct analysis by others.

We believe that many potential users who would not mount the effort required to conduct computer analyses of archived data will be able to get most of what they want from these volumes of descriptive results. The user of any one of these volumes can estimate—usually with considerable accuracy—a wide variety of characteristics of the high school class described in that volume. To take just one example, the user of the 1994 volume can ascertain that 30.7 percent of seniors in the high school class of 1994 reported using marijuana at least once during the preceding year. Further, by utilizing

*The 1975 volume does not include comparison data for African American and white subgroups, nor does it include data for the subgroups who did and did not plan to complete four years of college. Also, somewhat fewer questionnaire items appear than in the other volumes. These restrictions are the result primarily of missing data problems that occurred only in the 1975 survey. In most respects, however, those seeking to compare different classes of high school seniors will find the 1975 data useful.

two or more of these volumes, the reader can describe recent trends in any such characteristic. To continue with the same example, the volume describing the high school class of 1975 indicates that 40.0 percent of these seniors reported marijuana use during the preceding year; and when that is combined with the data from the intervening years, the reader is able to discern a steady increase between 1975 and 1979 (50.8 percent of that class reported having used marijuana at least once in the preceding year) and a subsequent steady decrease, through 1992, to below the 1975 level. Between 1992 and 1997, there was an increase in marijuana use; from 1997 to 2006, there was a decline, little further change in 2007, and some increase in 2008. The figures for the years 1975 to 2008 are:

	%		%		%		%
1975	40.0	1984	40.0	1993	26.0	2002	36.2
1976	44.5	1985	40.6	1994	30.7	2003	34.9
1977	47.6	1986	38.8	1995	34.7	2004	34.3
1978	50.2	1987	36.3	1996	35.8	2005	33.6
1979	50.8	1988	33.1	1997	38.5	2006	31.5
1980	48.8	1989	29.6	1998	37.5	2007	31.7
1981	46.1	1990	27.0	1999	37.8	2008	32.4
1982	44.3	1991	23.9	2000	36.5		
1983	42.3	1992	21.9	2001	37.0		

A similar examination of trends can be carried out for about 1,400 different variables dealing with a wide variety of subject areas (listed in Table 2 of the Introduction). A simple indexing system (described below) has been developed that makes it quite straightforward for the reader wishing to do trend analyses to locate the results for a given question for any year of the study. The index in the present volume lists the location of all items included in the surveys from 1976 onward.

Analyses such as those illustrated above need not be limited to the total sample. The data provided in these volumes also permit examination of a variety of subgroups (e.g., males, females, those from different regions, and those with different levels of drug use experience).

We recognize that providing ready access to essentially undigested data carries certain risks, particularly the risk of mistaken interpretations based on inadequate controls, lack of awareness of sample limitations, etc. More than offsetting the risks, in our view, are the advantages of prompt and widespread dissemination of these nationally representative survey indicator data. Although we are unable to eliminate the risks, we hope to reduce them by providing the reader with an extensive list of caveats presented at the end of the Introduction section. We ask all who use the data to read these caveats carefully and take them seriously.

A Guide for the Reader

This volume is divided into three main parts: (1) the introductory section, (2) the section giving the descriptive results from the current year's survey, and (3) the cross-time item reference index.

Introductory Section. The introduction contains a description of the study—its purposes, major content areas, design, field procedures, response rates, and methods of publication and data dissemination. Since most of this material remains unchanged from year to year, anyone having read another of the volumes may wish to skim this section. We do, however, suggest reviewing the caveats, located at the end of the introductory section, which deal with interpreting and extrapolating from these data.

Descriptive Results Section. In this section, all questions contained in this year's survey are presented along with percentagized frequency distributions of answers for the entire sample and for selected subgroups. The questions in this section are organized according to the number of the questionnaire form in which they were contained (Forms 1 through 5 in 1975–88 and Forms 1 through 6 in 1989 on) and according to the order in which the questions occurred. There is one important exception, however. A major segment of questions common to all forms of the questionnaire (dealing with drug use, background characteristics, and some other subjects) is presented only once, at the beginning of the Descriptive Results section, using the data from respondents on all forms. Table 3 (Prevalence of Drug Use Question Numbers by Questionnaire Form, 2008), in the Introduction to this volume, lists the form and question numbers of all prevalence of drug use questions appearing in the Descriptive Results section.

The first portion of the Descriptive Results section contains detailed definitions of all subgroups for whom data are presented. It also describes the statistical conventions used in generating the tables.

Cross-Time Index of Questionnaire Items. Beginning with the 1982 volume, this index is

ordered by subject area. (It was ordered by item reference number prior to 1982.) The index is intended to serve two purposes.

First, it should be useful in locating items dealing with a subject area of interest. The subject area key at the beginning of the cross-time item index shows the alphanumeric code assigned to various subject areas (e.g., "politics" or "work and leisure"). Having selected a subject area of interest, one can then go to that section of the index to locate all questions in any of the surveys that deal with that subject. (The procedure is slightly different in volumes prior to 1982, as described in those volumes.) To locate the results for any given question in this volume, simply look in column two of the item index for its page location.

The cross-time index can also be used to determine in which other years an item was used and where to locate it. If, in reviewing the Descriptive Results section, one locates an interesting item and would like to know in which of the other annual surveys of seniors it has appeared, it may be found in the cross-time index by the unique "item reference number" within the relevant subject area. The index will indicate all years in which that same item appeared and show the questionnaire form, section, and item number for each year. This information thus can be used to decide which other volumes in this series might be of relevance; and the same item may be readily located by its reference number in the index of any other volume prior to the 1982 volume and by its subject area and reference number in any volume from 1982 on.

Sampling Appendices. Appendix A is provided for those wishing to determine the confidence limits around a percentage estimate, to test the statistical significance of an observed difference between two groups, or to test the significance of a change from one year to another. It gives the necessary procedures and tables for such tests and provides the appropriate factors by which to correct for the fact that the study makes use of a multi-stage probability sample clustered in a limited number of schools (usually about 130). Appendix B provides further detail on sample design effects and the procedures that were used to derive the sampling error estimates.

Availability of Archived Data

As was mentioned earlier, this series of volumes is complemented by an archiving of the raw data set for direct analysis by others not associated with the project. The present volumes should be a considerable help to those wishing to access the archived data since they provide a verbatim statement of items and answer categories and, also, because they include basic univariate and bivariate frequency distributions for all items, as well as the missing data rates. The cross-time index of items contained in each of these volumes also provides an efficient way to identify the relevant variables in various content areas, as well as to determine when they were measured and their questionnaire locations. In fact, we hope that the availability of this series will not only facilitate the use of the archived data but actually stimulate interest in their use.

The individual-level data that are summarized in this and previous volumes are available from:

The Substance Abuse and Mental Health Data Archive (SAMHDA)
The Inter-university Consortium for Political and Social Research (ICPSR)
Institute for Social Research
P.O. Box 1248
Ann Arbor, MI 48106-1248

The ICPSR archive makes individual-level data available to interested investigators for analysis. A few variables have been modified or deleted to ensure that the answers of an individual respondent cannot be located through pattern recognition (i.e., using various descriptor variables in combination to make a unique identification). The changed or deleted variables include month of birth, race, and the sampling weight, which adjusts for selection probability. To access the data, see the SAMHDA website at:

http://www.ICPSR.umich.edu/SAMHDA

Other Publications from the Study

A number of different forms of publications based on Monitoring the Future data have been developed or are being planned. One series of reports, dealing with trends in drug use and drug-related attitudes and beliefs, is being published by the National Institute on Drug Abuse. The first report in that series, *Drug Use among American High School Students, 1975–1977* (Johnston, Bachman, and O'Malley), was published in late 1977. Subsequent

*Single copies of these reports may be ordered without cost from the National Clearinghouse for Alcohol and Drug Information, P.O. Box 2345, Rockville, MD 20847-2345, 1-800-729-6686, e-mail information@NIDA.NIH.gov.

reports have been issued annually.* The most recent two-volume report in this series is *National Survey Results on Drug Use from the Monitoring the Future Study, 1975–2008* (Johnston, O'Malley, Bachman, and Schulenberg, 2009b). As a supplement to the series, Occasional Paper No. 71 presents subgroup trends in substance use graphically. This is available online only. An occasional paper series has been launched by the project. It includes papers on design and methodological issues as well as special substantive analyses and early, and sometimes more detailed, drafts of articles planned for journal publication. Occasional Paper No. 64, "The Monitoring the Future Project after 32 Years: Design and Procedures" (Bachman, Johnston, O'Malley and, Schulenberg, 2006), provides a detailed description of the study and its underlying rationale; Occasional Paper No. 65, "The Aims and Objectives of the Monitoring the Future Study and Progress toward Fulfilling Them as of 2006" (Johnston, O'Malley, Schulenberg, and Bachman, 2006) provides a description of the study's objectives.

The present series of reference volumes is being published by the Institute for Social Research. A new volume will be added to this series each year.

To request particular papers, reprints, or periodic notification of publications available from the study, write to:

Monitoring the Future, Room 2311

Acknowledgments

A great many people have contributed to the launching and development of this research effort. We are indebted to a number of officials of the National Institute on Drug Abuse and the Special Action Office for Drug Abuse Prevention for their encouragement and advice at the outset—in particular, Richard Bucher, Robert DuPont, William Pollin, and Louise Richards.

Our colleagues at the Institute for Social Research and elsewhere, who shared their insights, and often their most cherished instrumentation, are too numerous to mention; but their contributions are greatly appreciated. To the former director of the Survey Research Center's Sampling Section, Irene Hess, and to her colleagues and her successor, Steven Heeringa, we owe a particular debt for the creativity of the sampling design for the study. The contributions of the SRC Field Section were also very valuable.

Major contributions to the production of this particular volume were made by staff members Ginger Maggio, Patricia Berglund, and Adam Burke.

The present and former members of the project staff (listed on the next page) have, of course, contributed greatly to the building of this large and complex research series.

Finally, we would like to acknowledge the tens of thousands of high school seniors, their teachers, and their principals, whose cooperation and generous contributions of time make the Monitoring the Future project possible.

Introduction

The Monitoring the Future project is designed to explore changes in many important values, behaviors, and attitudes of contemporary American youth. Two general types of tasks may be distinguished. The first is to provide a systematic and accurate *description* of the youth population of interest in a given year and to quantify the direction and rate of the changes taking place among them over time. The second task, more analytic than descriptive, involves the *explanation* of the relationships and trends observed to exist.

The task of description may be subdivided into three parts: (1) the description of static conditions (which may be accomplished through a single cross-sectional study); (2) the description of cross-cohort or, in longer time-spans, generational changes (usually accomplished using repeated cross-sections of the same age groups); and (3) the description of changes with aging (usually accomplished by means of longitudinal studies). The Monitoring the Future project has the capacity to provide each of these three types of descriptions, since it incorporates all three types of research design into a single study. (This complex design, in which multiple cohorts are followed longitudinally, has been referred to as a cohort-sequential design.)

The content of this volume exemplifies the first of these types of description in that it contains cross-sectional data on a single high school class. When the data in this volume are used in combination with data from other such volumes in the series, the nature, direction, and rates of change from one cohort of seniors to another also may be described—the type of reporting that is often labeled as the social indicator approach. The third class of description—dealing with the maturational changes that occur during the years after high school—is not dealt with in this series of volumes but is reported in other publications from the study.*

The accurate characterization of American young people and the description of important changes occurring among them is but one class of objectives for the study. The second class of objectives involves the development of a greater understanding of what causes these young people to be as they are and why the changes being documented are occurring. An explanation will be sought through both the analysis of change at the aggregate level and at the individual level. The results of these explorations will be disseminated via the various publications discussed in the Preface.

The merging of the social indicator approach and the analysis of relationships (particularly longitudinal relationships) into a single cohort-sequential design is, in our view, synergistic: the effectiveness of the two approaches combined is greater than if the two were undertaken separately. Because the present series of volumes deals with senior year data only, our remarks here focus primarily on the project's social indicator contributions—the accurate description of high school seniors and the documentation of trends over time. It is worth noting, however, that even the limited amount of bivariate data included in the present volumes will suggest promising directions for relational analyses, many of which can be carried out using the archived data tapes from the project.

*Panels of students from each graduating class are randomly selected and followed longitudinally by mail. Individuals are surveyed biennially through age 30 and then at five-year intervals. These data allow the characterization of the changes that occur during the early adult years and on through age 50. In addition, the data allow the cross-sectional characterization each year of most Americans (excluding high-school dropouts) in those age groups and the changes occurring in those characteristics.

The Need for Social Indicators

The fundamental argument for developing social indicators is that there are considerable scientific and practical benefits derived from having accurate information about current social realities and the way those realities have been changing. For the scientific community, such indicators provide a rich set of information against which existing theory may be tested and from which new theory may be suggested. For the community at large, social indicators permit the "reality testing" of common perceptions and beliefs about the nation and its people. Past experience has demonstrated that widely held conceptions, which themselves may serve to create or exacerbate problems, can be most inaccurate. One example is the exaggerated popular conception of the size and nature of the "gap" between generations (see Adelson, 1970, 1979); another is the mistaken assumption that most young people condone the use of a variety of illegal drugs (Johnston, 1973; Johnston, O'Malley, Bachman, and Schulenberg, 2009b).

While deflating exaggerated perceptions, a continual monitoring of indicators on youth also can reveal the beginning of new problems and thus give rise to corrective efforts at a relatively early stage. For instance, most would view with concern the emergence of new types of drug use. Monitoring the Future documented and reported a sharp increase in regular marijuana use among high school seniors in the late 70s, and, as a result, more attention was paid to the issue by policy makers, the media, and the general public. The discovery of such trends may trigger more intense efforts to discover the causes, consequences, and (when appropriate) preventatives of such behaviors.

Although social indicators seldom translate directly into specific policy decisions, the availability of descriptive information can substantially enhance the decision-making capabilities of policy makers. These data provide considerable insight into the size and nature of problems, the rate of change occurring nationally and in subgroups, and, in some instances, information about related factors and even the likely impacts of major social interventions (such as changed drug laws or new incentives for recruitment into the military, to name but two). They also provide the possibility of feedback on the consequences of some social interventions as well as major historical events.

The particular topics included in our monitoring system are summarized later in this introduction and, of course, they are presented fully in the complete set of data tables. For present purposes, it is enough to indicate that the range of topics is very broad. This breadth is partly due to the wide interests of the principal investigators; but it also reflects our conviction that the concurrent examination of trends in a variety of areas is not only much more cost efficient but also more scientifically productive.

Research Design and Procedures*

The basic research design involves annual data collections from high school seniors during the spring of each year, beginning with the class of 1975. Each data collection takes place in approximately 130 public and private high schools selected to provide an accurate cross-section of high school seniors throughout the coterminous United States. The design also provides for the longitudinal study of a subsample from each class of participating seniors; but since the focus of this series of volumes is exclusively on the data collected annually from seniors, the follow-up procedures will not be discussed here.

Reasons for Focusing on High School Seniors. There are several reasons for choosing the senior year of high school as an optimal point for monitoring the behaviors and attitudes of youth. One is that the completion of high school represents the end of an important developmental stage in this society, since it demarcates both the end of universal public education and, for many, the end of living in the parental home. Therefore, it is a logical point at which to take stock of the accumulated influences of these two environments on American youth.

Further, the completion of high school represents the jumping off point from which young people diverge into widely differing social environments, including college, business firms, military service, and homemaking. But these environmental transitions are not the only important changes that coincide with the end of high school. Most young men and women now reach the formal age of adulthood shortly before or after graduation; more

*A more extensive description of the research design and procedures may be found in Bachman and Johnston (1978), Bachman, Johnston, and O'Malley (2006), or Johnston, O'Malley, Bachman , and Schulenberg (2009b).

significantly, they begin to assume adult roles, including financial self-support, marriage, and parenthood.

Finally, there are some important practical advantages to building a system of data collections around samples of high school seniors. The last year of high school constitutes the final point at which a reasonably good national sample of an age-specific cohort can be drawn and studied economically. The need for systematically repeated, large-scale samples from which to make reliable estimates of change requires that considerable stress be laid on efficiency and feasibility; the present design meets those requirements.

One limitation in the design is that it does not include in the target population those young men and women who drop out of high school before graduation (or before the last few months of the senior year, to be more precise). This excludes a relatively small proportion of each age cohort—between 15 and 20 percent (U.S. Bureau of the Census, various years)—though not an unimportant segment, since we know that certain behaviors such as illicit drug use (Johnston, 1973) and delinquency (Bachman, O'Malley, and Johnston, 1978) tend to be higher than average in this group. However, the addition of a representative sample of dropouts would increase the cost of the present research enormously, because of their dispersion and generally higher level of resistance to being located and interviewed.

For the purposes of estimating characteristics of the entire age group, the omission of high school dropouts does introduce certain biases; however, their small proportion sets outer limits on the bias (Johnston, O'Malley, Bachman, and Schulenberg, 2009b, Appendix). For the purposes of estimating *changes* from one cohort of high school seniors to another, the omission of dropouts represents a problem only if different cohorts have considerably different proportions who drop out. We have no reason to expect dramatic changes in those rates for the foreseeable future, and recently published government statistics indicate a great deal of stability in dropout rates since 1970 (U.S. Bureau of the Census, various years).

Some may use our high school data to draw conclusions about changes for the entire age group. While we do not encourage such extrapolation, we suspect that the conclusions reached often would be valid, since over 80 percent of the age group is in the surveyed segment of the population *and* we expect that changes among those not in school are very likely to parallel the changes among those who are.

Sampling Procedures. The procedure for securing a nationwide sample of high school seniors is a multi-stage one. Stage 1 is the selection of particular geographic areas, Stage 2 is the selection of one or more high schools in each area, and Stage 3 is the selection of seniors within each high school.

Stage 1: Geographic Areas. The geographic areas used in this study are the primary sampling units (PSUs) developed by the Sampling Section of the Survey Research Center for use in the center's nationwide interview studies. Because these same PSUs are used for personal interview studies by the Survey Research Center (SRC), local field representatives can be assigned to administer the data collections in practically all schools.

Stage 2: Schools. In the major metropolitan areas more than one high school is often included in the sampling design; in most other sampling areas a single high school is sampled. In all cases, the selections of high schools are made such that the probability of drawing a school is proportionate to the size of its senior class. The larger the senior class (according to recent records), the higher the selection probability assigned to the high school. When a sampled school is unwilling to participate, a replacement school as similar to it as possible is selected from the same geographic area.

Stage 3: Students. Within each selected school, up to about 350 seniors may be included in the data collection. In schools with fewer than 350 seniors, the usual procedure is to include all of them in the data collection. In larger schools, a subset of seniors is selected either by randomly sampling classrooms or by some other random method that is convenient for the school and judged to be unbiased. Sample weights are assigned to each respondent so as to take into account variations in the sizes of samples from one school to another, as well as (smaller) variations in selection probabilities occurring at the earlier stages of sampling.

The three-stage sampling procedure described above yielded the number of participating schools and students indicated in Table 1.

Table 1
Sample Sizes and Student Response Rates

	Number of:				
Year	Public Schools	Private Schools	Total Schools	Students*	Student Response Rate**
1975	111	14	125	15.791	78%
1976	108	15	123	16.678	77%
1977	108	16	124	18.436	79%
1978	111	20	131	18.924	83%
1979	111	20	131	16.662	82%
1980	107	20	127	16.524	82%
1981	109	19	128	18.267	81%
1982	116	21	137	18.348	83%
1983	112	22	134	16.947	84%
1984	117	17	134	16.499	83%
1985	115	17	132	16.502	84%
1986	113	16	129	15.713	83%
1987	117	18	135	16.843	84%
1988	113	19	132	16.795	83%
1989	111	22	133	17.142	86%
1990	114	23	137	15.676	86%
1991	117	19	136	15.483	83%
1992	120	18	138	16.251	84%
1993	121	18	139	16.763	84%
1994	119	20	139	15.929	84%
1995	120	24	144	15.876	84%
1996	118	21	139	14.824	83%
1997	125	21	146	15.963	83%
1998	124	20	144	15.780	82%
1999	124	19	143	14.056	83%
2000	116	18	134	13.286	83%
2001	117	17	134	13.304	82%
2002	102	18	120	13.544	83%
2003	103	19	122	15.200	83%
2004	109	19	128	15.222	82%
2005	108	21	129	15.378	82%
2006	116	20	136	14,814	83%
2007	111	21	132	15,132	81%
2008	103	17	120	14,577	79%

*Sample weights are assigned to each respondent to correct for unequal probabilities of selection that arise in the multi-stage sampling procedure.
**The student response rate is derived by dividing the attained sample by the target sample (both based on weighted number of cases). The target sample is based upon listings provided by schools. Since such listings may fail to take account of recent student attrition, the actual response rate may be slightly underestimated.

One other important feature of the base-year sampling procedures should be noted here. All schools (except for half of the initial 1975 sample) are asked to participate in two data collections, thereby permitting replacement of half of the total sample of schools each year. One motivation for requesting that schools participate for two years is administrative efficiency: it is a costly and time-consuming procedure to secure the cooperation of schools, and a two-year period of participation cuts down that effort substantially. Another important advantage is that whenever an appreciable shift in scores from one graduating class to the next is observed, it is possible to check whether the shift might be attributable to some differences in the newly sampled schools. This is done simply by repeating the analysis using only the 60 or so schools that participated both years. Thus far, the half-sample approach has worked quite well; and examination of drug prevalence of use data from the "matched half-samples" showed that the half-samples of repeat schools yielded drug prevalence of use trends that were virtually identical to trends based on all schools.

School Recruiting Procedures. Early during the fall semester, an initial contact is made with each sampled school. First, a letter is sent to the principal describing the study and requesting permission to survey seniors. The letter is followed by a telephone call from a project staff member, who attempts to deal with any questions or problems and (when necessary) makes arrangements to contact and seek permission from other school district officials. Basically the same procedures are followed for schools asked to participate for the second year.

Once the school's agreement to participate is obtained, arrangements are made by phone for administering the questionnaires. A specific date for the survey is mutually agreed upon and a local SRC representative is assigned to carry out the administration.

Advance Contact with Teachers and Students. The local SRC representative is instructed to visit the school two weeks ahead of the actual date of administration. This visit serves as an occasion to meet the teachers whose classes will be affected and to provide them with a brochure describing the study, a brief set of guidelines about the questionnaire administration, and a supply of flyers to be distributed to the students a week to 10 days

in advance of the questionnaire administration. The guidelines to the teachers include a suggested announcement to students at the time the flyers are distributed.

From the students' standpoint, the first information about the study usually consists of the teacher's announcement and the short descriptive flyer. In announcing the study, the teachers are asked to stress that the questionnaires used in the survey are not tests and that there are no right or wrong answers. The flyer tells students that they will be invited to participate in the study, points out that their participation is strictly voluntary, and stresses confidentiality (including a reference to the fact that the Monitoring the Future project has a special government grant of confidentiality that allows their answers to be protected). The flyer also serves as an informative document that the students can show to their parents.

Questionnaire Administrations. The questionnaire administration in each school is carried out by the local SRC representatives and their assistants, following standardized procedures detailed in a project instruction manual. The questionnaires are administered in classrooms during normal class periods whenever possible, although circumstances in some schools require the use of larger group administrations. Teachers are not asked to do anything more than introduce the SRC staff members and (in most cases) remain in the classroom to help guarantee an orderly atmosphere for the survey. Teachers are urged to avoid walking around the room, so that students may feel free to write their answers without fear of being observed.

The actual process of completing the questionnaire is quite straightforward. Respondents are given sharpened pencils and asked to use them because the questionnaires are designed for automatic scanning. Most respondents can finish within a 45-minute class period; for those who cannot, an effort is made to provide a few minutes of additional time.

Procedures for Protecting Confidentiality. In any study that relies on the voluntary reporting of drug use or other illegal acts, it is essential to develop procedures that guarantee the confidentiality of such reports. It is also desirable that these procedures be described adequately to respondents so that they are comfortable about providing honest answers.

We noted that the first information given to students about the survey consists of a descriptive flyer stressing confidentiality and voluntary participation. This theme is repeated at the start of the questionnaire administration. Each participating student is instructed to read the message on the cover of the questionnaire, which stresses the importance and value of the study, notes that answers will be kept strictly confidential, states that the study is completely voluntary, and tells the student, "If there is any question you or your parents would find objectionable for any reason, just leave it blank." The instructions then point out that in a few months a summary of nationwide results will be mailed to all participants and also that a follow-up questionnaire will be sent to some students after a year. The cover message explains that these are the reasons for asking that name and address be written on a special form that will be removed from the questionnaire and handed in separately. The message also points out that the two different code numbers (one on the questionnaire and one on the tear-out form) cannot be matched except by a special computer file at the University of Michigan. (The content of the inside and outside of the standard questionnaire cover, including the tear-out form, may be found in Appendix C.)

Content Areas and Questionnaire Design

Drug use and related attitudes are the topics that receive the most extensive coverage in the Monitoring the Future project; but the questionnaires also deal with a wide range of other subject areas, including attitudes about government, social institutions, race relations, changing roles for women, educational aspirations, occupational aims, and marital and family plans, as well as a variety of background and demographic factors. (Table 2 provides an outline of the 20 general subject areas into which all items are categorized in the Question Index toward the end of this volume.) Given this breadth of content, the study is not presented to respondents as a "drug use study," nor do they tend to view it as such.

Because many questions are needed to cover all of these topic areas, much of the questionnaire content is divided into different questionnaire forms that are distributed to participants in an ordered sequence. (Five forms were used in 1975-88; a sixth form was added in 1989.) This sequence

Table 2
Measurement Content Areas
(Abbreviated Version*)

A.	**Drugs**. Drug use and related attitudes and beliefs, drug availability and exposure, surrounding conditions and social meanings of drug use. Views of significant others regarding drugs.
B.	**Education**. Educational lifestyle, values, experiences, and environments.
C.	**Work and Leisure**. Vocational values, meaning of work and leisure, work and leisure activities, preferences regarding occupational characteristics and type of work setting.
D.	**Sex Roles and Family**. Values, attitudes, and expectations about marriage, family structure, sex roles, and sex discrimination.
E.	**Population Concerns**. Values and attitudes about overpopulation and birth control.
F.	**Conservation, Materialism, Equity, etc**. Values, attitudes, and expectations related to conservation, pollution, materialism, equity, and the sharing of resources. Preferences regarding type of dwelling and urbanicity.
G.	**Religion**. Religious preferences, activities, and views.
H.	**Politics**. Political affiliation, activities, and views.
I.	**Social Change**. Values, attitudes, and expectations about social change.
J.	**Social Problems**. Concern with various social problems facing the nation and the world.
K.	**Major Social Institutions**. Confidence in and commitment to various major social institutions (business, unions, branches of government, press, organized religion, military, etc.).
L.	**Military**. Views about the armed services and the use of military force. Personal plans for military service.
M.	**Interpersonal Relationships**. Qualitative and quantitative characteristics of cross-age and peer relationships. Interpersonal conflict.
N.	**Race Relations**. Attitudes toward and experiences with other racial groups.
O.	**Concern for Others**. Concern for others, voluntary and charitable activities.
P.	**Happiness**. Happiness and life satisfaction, overall and in specific life domains.
Q.	**Other Personality Variables**. Attitudes about self (including self-esteem), locus of control, loneliness, risk-taking, trust in others, importance placed on various life goals, counterculture orientation, hostility, boredom.
R.	**Background**. Demographic and family background characteristics, living arrangements.
S.	**Deviance and Victimization**. Delinquent behaviors, driving violations and accidents (including those under the influence of drugs), victimization experiences.
T.	**Health**. Health habits, somatic symptoms, medical treatment.

*For a more detailed listing of measurement content areas, see Table 4.

Table 3
Prevalence of Drug Use Question Numbers by Questionnaire Form, 2008

Data for question numbers appearing in **boldface type** are published in this volume. Data for question numbers **not in boldface type** are not presented in this volume but, where appropriate, are included in the combined Forms 1–6 data. For marijuana, cocaine and heroin, the combined Forms 1–6 data comprise data from the general use question in some forms and component data in other forms. For example, the combined Forms 1–6 data for cocaine are a combination of data from the general cocaine use question in Forms 2 and 5 and data from the component crack and other forms of cocaine questions in Forms 1, 3, 4, and 6. Form 1 marijuana data and hashish data are combined to create the marijuana/hashish data for Form 1 and are then used with the general marijuana/hashish data in Forms 2–6 to create the combined Forms 1–6 data. Data on heroin use with and without a needle are combined to create the heroin data for Forms 2, 5, and 6 and are then used with the general heroin use questions in Forms 1, 3, and 4 to create the combined Forms 1–6 heroin data.

[a]Asked in a set after a branching question about any use of hallucinogens other than LSD.
[b]Asked in a set after a branching question about any use of amphetamines.
[c]Asked in a set after a branching question about any use of sedatives.
[d]Asked in a set after a branching question about any use of tranquilizers.
[e]Asked in a set after a branching question about any use of narcotics other than heroin.

produces five or six virtually identical subsamples. About one-third of each questionnaire form consists of key or "core" variables that are common to all forms. All demographic variables and some measures of drug use are included in this "core" set of measures. This use of the full sample for drug and demographic measures provides a more accurate estimation on these dimensions and also makes it possible to link them statistically to all of the other measures that are included in a single form only.*

Representativeness and Validity

The samples for this study are intended to be representative of high school seniors throughout the 48 coterminous states. We have already discussed the fact that this definition of the sample excludes one important portion of the age cohort: those who have dropped out of high school before nearing the end of the senior year. But given the aim of representing high school seniors, it will now be useful to consider the extent to which the obtained samples of schools and students are likely to be representative of all seniors and the degree to which the data obtained are likely to be valid.

We can distinguish at least four ways in which survey data of this sort might fall short of being fully accurate. First, some sampled schools refuse to participate, which could introduce some bias. Second, the failure to obtain questionnaire data from 100 percent of the students sampled in participating schools would also introduce bias. Third, the answers provided by participating students are open to both conscious and unconscious distortions that could reduce validity. Finally, limitations in sample size and/or design could place limits on the accuracy of estimates. Each of these issues is treated extensively elsewhere (Johnston, O'Malley, and Bachman, 1984, especially Appendices A and B), so in this section we will present only the highlights of each of those discussions.

School Participation. As noted in the description of the sampling design, schools are invited to participate in the study for a two-year period. With very few exceptions, each school that has participated for one data collection has agreed to participate for a second. Thus far, an average of about 65 percent of the schools initially invited to participate have agreed to do so each year; for each school refusal, a similar school (in terms of size, geographic area, urbanicity, etc.) was recruited as a replacement. The selection of replacement schools almost entirely removes problems of bias in region, urbanicity, and the like that might result from certain schools refusing to participate. Other potential biases are more subtle, however. For example, if it turned out that most schools with "drug problems" refused to participate, that could seriously bias the drug estimates derived from the sample. And if any other single factor were dominant in most refusals, that also might suggest a source of serious bias. In fact, however, the reasons for schools' refusals to participate are varied and largely a function of happenstance events of the particular year. Thus, we feel fairly confident that school refusals have not seriously biased the surveys.

Student Participation. Completed questionnaires are obtained from three-fourths to four-fifths of all students sampled. The single most important reason that students are missed is that they are absent from class at the time of data collection, and in most cases it is not workable to schedule a special follow-up data collection for them. Students with fairly high rates of absenteeism also report above-average rates of drug use; therefore, there is some degree of bias introduced by missing the absentees. That bias could be largely corrected through the use of special weighting; however, this course was not chosen because the bias in estimates (for drug use, where the potential effect was hypothesized to be the largest) was determined to be quite small and because the necessary weighting procedures would have introduced undesirable complications.

In addition to absenteeism, student nonparticipation occurs because of schedule conflicts with school trips and other activities that tend to be more frequent than usual during the final months of the senior year. Of course, some students refuse to complete or turn in the questionnaire. However, the SRC representatives in the field estimate this proportion to be only about 1 percent.

Validity of Self-Report Data. Survey measures of delinquency and of drug use depend upon respondents reporting what are, in many cases, illegal acts. Thus, a critical question is whether such self-reports are likely to be valid.

Like most studies dealing with these areas, we have no direct, objective validation of the present measures; however, the considerable amount of inferential evidence that exists strongly suggests that the self-report questions produce largely valid

*These core variables are the first ones on which data are presented in the Descriptive Results section.

data. A number of factors have given us reasonable confidence about the validity of the responses to what are presumably among the most sensitive questions in the study: a low nonresponse on the drug questions; a large proportion admitting to some illicit drug use; the consistency of findings across several years of the present study; strong evidence of construct validity (based on relationships observed between variables); a close match between our data and the findings from other studies using other methods; and the findings from several methodological studies that have used objective validation methods.*

As for others of the measures, a few have a long and venerable history—as scholars of the relevant literatures will recognize—though some of these measures have been modified to fit the present questionnaire format. Many (probably most) questions, however, have been developed specifically for this project through a careful process of question writing, pilot testing, pretesting, and question revision or elimination. Some already have been included in other publications from the study, but many have not; therefore, there currently exists little *empirical* evidence of their validity and reliability. On the other hand, the fact that virtually all results presented in this volume are based on individual items, rather than indexes or abstract concepts, should make it easy for the reader to judge the degree to which each item has "face validity" and also the degree to which there is some evidence of construct validity in the bivariate results.

Accuracy of the Sample. A sample survey never can provide the same level of accuracy as would be obtained if the entire target population were to participate in the survey—in the case of the present study, about 2.5–4.0 million seniors per year. However, perfect accuracy of this sort would be extremely expensive and certainly not worthwhile considering the fact that a high level of accuracy can be provided by a carefully designed probability sample. The accuracy of the sample in this study is affected both by the size of the student sample and by the number of schools in which they are clustered. Appendix B presents a discussion of the ways in which this clustering and other aspects of the sampling design are taken into account in computing the precision or accuracy of the samples. For the purposes of this introduction, it is sufficient to note that virtually all estimates based on the total sample have confidence intervals of ±1.5 percentage points or smaller—sometimes considerably smaller. This means that, had we been able to invite all schools and all seniors in the 48 coterminous states to participate, the results from such a massive survey would be within an estimated 1.5 percentage points of our present sample findings at least 95 times out of 100. We consider this to be a quite high level of accuracy, one that permits the detection of fairly small trends from one year to the next.

Consistency and the Measurement of Trends. One other point is worth noting in a discussion of the validity of our findings. The Monitoring the Future project is, by intention, a study designed to be sensitive to changes from one time to another. Accordingly, the measures and procedures have been standardized and applied consistently across each data collection. To the extent that any biases remain because of limits in school and/or student participation, and to the extent that there are distortions (lack of validity) in the responses of some students, it seems very likely that such problems will exist in much the same way from one year to the next. In other words, biases in the survey estimates should tend to be consistent from one year to another, which means that the measurement of *trends* should be affected very little by any such biases.

Caveats to Users of the Data

In attempting to understand and interpret the statistical results contained in this volume, the reader should keep in mind the several considerations discussed below.

Estimation of Sampling Errors. Appendix A provides figures that allow the reader to determine the 95 percent confidence interval around any observed percentage for both the total sample and the several subgroups for which statistics are given. Appendix A also provides tables and guidelines for testing the statistical significance of observed differences between subgroups (e.g., males vs. females) and the significance of year-to-year changes for the entire sample and for the various subgroups on any given variable. Estimates based on subgroups

*A more detailed discussion of the evidence for validity of the measures of illicit drug use may be found in Johnston et al. (2009b). An analysis of inconsistencies in students' reports of monthly vs. yearly drug use is provided by Bachman and O'Malley (1981).

containing relatively few cases (e.g., those who have used heroin) will have substantially larger margins of error than those subgroups with large numbers of cases.

Subgroup Definitions. At the beginning of the Descriptive Results section there is a careful definition of each of the subgroups analyzed in this series of volumes. It is important for the reader to read these definitions so as not to be misled by the necessarily abbreviated descriptions given in the column headings of the data tables. For example, the column labeled "4-Year College Plans" includes data only for seniors who expect to graduate from a four-year college, which is only a subset of all who expect to receive some college training. To take another example, several column headings in the lifetime illicit drug use index use the term "pills"; however, these categories contain people who indicate that they used any of a number of drugs—including some that usually are not taken in pill form (e.g., cocaine and narcotics other than heroin).

Missing Data Notes. Each column of percentages for a given variable adds to 100 percent (with slight variations due to rounding), whether based on the entire sample or any one of the subgroups being described. Missing data were not included in computing these percentages, so it is up to the reader to determine whether an exceptional level of missing data exists on any given question. This can be done by comparing the weighted number of cases on which those percentages were based (given in italics under each percentage distribution) with the total number of weighted cases who took the questionnaire (given at the top of the same column). As would be expected, the missing data rate tends to rise modestly toward the end of each questionnaire. Occasionally there is an exceptional level of nonresponse for some other reason, the most common being that the respondent has been branched around a question or set of questions that are inappropriate for him or her. In this case, the percentages are based only on those for whom the question was appropriate *and* who answered. A footnote has been entered to help call attention to the fact that completing a particular question is contingent upon the answer on a prior question. Most such cases are contained in Form 1 of the questionnaire, which has several sets of detailed questions about drug use that are answered only by those respondents who have used a particular class of drug during the past year.

Characterizing Heroin Users. Because this project places a special emphasis on the study of drug use, one set of columns distinguishes respondents according to the extent to which they have been involved with illicit drugs. The five drug use categories are based on an index of seriousness of involvement. The index has Guttman-like properties—that is, anyone classified at a given level is also very likely to have exhibited any drug-using behaviors that are associated with the lower levels in the index.

The most extreme category in the index is defined in terms of the respondent's ever having used heroin during his or her lifetime. However, any interpretations made about heroin users from these data must be tempered with extreme caution, not only because the small number of cases makes estimation in a given year relatively unreliable but also because the heroin users are probably the most selectively represented of all of the subgroups presented here. Heroin users—especially continuing users—are among those most likely to drop out of high school (Johnston, 1973). Therefore, we feel heroin users are particularly underrepresented in a sample of high school seniors. Furthermore, most of those included in the study report only very occasional heroin use. Frequent users—addicts, if you will—are not well represented in these data.

Given these problems with the representation of heroin users, the readers may wonder why it was decided to present them as a separate category of drug users. There are two reasons for doing so. First, because even occasional heroin use represents such an extreme point on the continuum of drug involvement, it seems preferable that the heroin users not be mixed in with the next highest category of use (the "more pills" category). It remains quite possible, of course, for anyone to *combine* any two or more categories in the drug use continuum (by computing means of percentages weighted by the number of cases in each category); therefore, those wishing to incorporate heroin users with the next category can do so whenever they wish. The second reason for keeping them separate is that we suspect the data based on high school seniors provide some indication of the characteristics that might be found among heavier heroin users who dropped out of school. Some variables in the study are strongly correlated with the drug use continuum, and the present heroin user category provides both an end point for that

continuum and an indication of the direction (further out on the continuum) in which heavier heroin users are likely to lie.

In sum, the reporting of separate percentages for heroin users among high school seniors permits greater clarity in analyzing other levels of drug use and provides data that may be suggestive about the larger population of young heroin users. But the particular data are clearly limited and should be interpreted with these cautions in mind.

Interpreting Racial Differences. Data are given for the two largest racial/ethnic subgroups in the population—those who identify themselves as white (Caucasian) and those who identify themselves as black or African American. Data are not given for the other ethnic categories (American Indian or Alaska Native, Asian American, Mexican American or Chicano, Puerto Rican, Cuban American, other Hispanic or Latino, or Native Hawaiian or other Pacific Islander) since each of these groups constitutes a small proportion of the sample in any given year, which means that their small *N*s (in combination with their clustered groupings in a limited number of schools) would yield estimates that would be too unreliable. In fact, even African Americans—who constitute approximately 12 percent of each year's sample—are represented by only 230 to 425 respondents per year on any single questionnaire form. Further, because our sample is a stratified clustered sample, it yields less accuracy than would be yielded by a pure random sample of equal size (see Appendix B for details). Therefore, because of the limited number of cases, the margin of sampling error around any statistic describing African Americans is larger than for most other subgroups described in this volume.

There exists, however, a quick way to determine the replicability of any finding involving racial comparisons. Since most questions are repeated from year to year, one can readily establish the degree to which a finding is replicated by looking at the results for the same question in prior or subsequent years. Given the relatively small *N*s for African Americans, the reader is urged to seek such replication before putting much faith in the reliability of any particular racial comparison.

There are factors in addition to unreliability, however, that could be misleading in the interpretation of racial differences. Given the social importance that has been placed on various racial differences reported in the social science literature, we would like to caution the reader to consider the various factors that could account for differences. These factors fall into three categories: differential representation in the sample, differential response tendencies, and the confounding of race with a number of other background and demographic characteristics.

Differential Representation. Census data characterizing American young people in the approximate age range of those in our sample show that somewhat lower proportions of African Americans than whites remain in school through the end of twelfth grade, though these differences have diminished appreciably in recent years. Therefore, a slightly different segment of the African American population than the white population resides in our target population of high school seniors. Further, our samples appear to under-represent slightly those African American males who, according to census figures, *are* in high school at the twelfth grade level. Identified African American males constitute about 6 percent of our sample, whereas census data suggest they should constitute about 7 percent. Therefore, it appears that we are losing more African American males from our target population than white males or females of either race. This may be due to generally poorer attendance rates on the part of some African American males and/or an unwillingness on the part of some to participate in data collections of this sort.

In sum, a smaller segment of the African American population than the white population of high school age is represented by the data contained here. Insofar as any characteristic is associated with being a school dropout or absentee, it is likely to be somewhat disproportionately underrepresented among African Americans in our sample.

Differential Response Tendencies. In examining our full range of variables, we have noted certain racial differences in response tendencies. First, the tendency to state agreement in response to agree–disagree questions is generally somewhat greater among African Americans than among whites. For example, African Americans tend to agree more with the positively worded items in our index of self-esteem, but they also tend to agree more with the negatively worded items. As it happens, that particular index has an equal number of positively and negatively worded items, so that any overall "agreement bias" should be self-canceling when the

index score is computed. Since all data in this volume are based on single items, however, group differences in agreement bias are likely to affect results on questions employing the agree–disagree format. Fortunately, most of our questions are not of that type.

We have also observed a somewhat greater than average tendency for African American respondents to select extreme answer categories on attitudinal scales. For example, even if the same proportion of African Americans as whites feel positively (or negatively) about some subject, fewer of the whites are likely to say they feel *very* positively (or *very* negatively). We do not have any ready explanations for these differences in response styles, but what seems important for our present purposes is that, in the process of interpreting racial differences, the reader should be aware that differences in response to particular questions may be related to these more general tendencies.

A somewhat separate issue in response tendency is a respondent's willingness to answer particular questions. The missing data rate, which can be determined by dividing the number responding to a question by the number taking the questionnaire (given at the top of each page), may reflect willingness to answer particular questions. If a particular question or set of questions has a missing data rate higher than is true for the prior or subsequent questions, then presumably more respondents than usual were unwilling (or perhaps unable) to answer it. We have observed such an exaggerated missing data rate for African American males on the set of questions dealing with the respondent's own use of illicit drugs. Clearly a respondent's willingness to be candid on such questions depends on his or her trust of the research process and of the researchers themselves. We interpret the exaggerated missing data rates for African American males in these sections as possibly reflecting, at least in part, less trust. The reader is advised to check for exceptional levels of missing data when making comparisons on any variable in which candor is likely to be reduced by lower system trust. One bit of additional evidence related to trust in the research process is that higher proportions of African Americans than whites indicated that if they had used marijuana or heroin, they would not have been willing to report it in the survey.

Covariance with Other Factors. Some characteristics such as race are highly confounded (correlated) with other variables—variables that may in fact explain some observed racial differences. Put another way, at the aggregate level we might observe a considerable racial difference on some characteristic, but once we control for some background characteristics such as socio-economic level or region of the country—that is, once we compare the African American respondents with whites who come from similar backgrounds—there may be no racial difference at all.

Race happens to be correlated with important background and demographic variables much more than some of the other variables dealt with here (such as the respondent's sex). When we compare males and females in this sample, we know that observed differences between them are not likely to be explained by differences in their family backgrounds (such as the socioeconomic level of their families, the region of the country, or the size of the cities in which they grew up) because males and females on the average come from extremely similar backgrounds. A perusal of Section C of Questionnaire Forms 1 through 6, however, will illustrate that on the average the African American subgroup in this sample is quite different from the white subgroup in a number of such respects. A higher proportion of African Americans live in the South and a higher proportion grew up in families with the father and/or mother absent, and more had mothers who worked while they were growing up. A substantially higher proportion of African Americans are Baptists, and African Americans tend to attribute more importance to religion in their lives than do whites. A higher proportion of African American respondents have children, and, on the average, they are slightly older than the white sample. As was mentioned earlier, African American males are more under-represented in our sample than African American females.

We note these differences in demographic, background, and ascriptive characteristics because, in any attempt to understand *why* a racial difference exists, one would want to be able to examine the role of these covarying characteristics. It is not possible, given the amount of data contained in this volume, to "factor out" the contribution of most of these covarying characteristics when interpreting racial differences. Therefore, while the data here may provide a relatively accurate *description* of racial differences (keeping in mind our earlier

cautions about representativeness and response style), they do not by themselves yield a great deal by way of explanation.

However, since the full data sets now reside in an archive, described in the Preface, it is possible for the reader to conduct a more in-depth exploration of observed differences—or nondifferences, for that matter. We particularly encourage readers interested in racial comparisons to make further explorations of the data in order to determine the possible role of the other variables discussed here. Users of the data are also encouraged to contact the principal investigators for information on the most recent analyses of racial differences, some of which have been published.*

Change in Race/Ethnicity Question. Since the beginning of the study, respondents have been presented a list of various racial/ethnic categories and instructed to select the *one* category that best describes them. In order to be more consistent with the Office of Management and Budget guidelines' method of assessing race/ethnicity, we revised our race/ethnicity measure. In 2005, the measure was changed in three of the six questionnaire forms. In these changed forms, respondents were presented with a list of racial/ethnic categories and instructed to "select one or more responses." An examination of the data showed that relatively few respondents (about 6% in 2005) selected more than one racial/ethnic category.

For the purposes of the race/ethnicity banner variable used in the 2005 volume, the data from the original race/ethnicity question were combined with data from the changed race/ethnicity question in the following manner: For the original question, respondents were assigned to the racial/ethnic group specified in their response. For the revised question, those checking only White and no other racial/ethnic group were categorized as White; those checking Black or African American and no other racial/ethnic group were categorized as Black. Note that in the combined forms section of the 2005 volume, because some drug use questions occurred in only one or a few forms, there is some variation in the version of the race/ethnicity question upon which the data are based. For the individual form data, the race/ethnicity banner variable is the version of the race/ethnicity question used in that particular form. Thus, in 2005 Forms 1, 3, and 5 contain data for the original race/ethnicity question and Forms 2, 4, and 6 contain data for the changed race/ethnicity question. Based on the analyses that we have examined, we do not believe these different permutations make an appreciable difference in the results. Beginning in the 2006 volume, all questionnaire forms used the revised question on race/ethnicity.

Given the long list of caveats about interpreting racial differences, one might ask why we chose to publish the statistics for racial subgroups at all. After considerable deliberation among ourselves as well as with colleagues more knowledgeable in the field of race relations, we concluded that the expected benefits of making these data available (along with this cautionary discussion) outweigh the potential costs of having them misused. Unfortunately, because African Americans constitute a relatively small proportion of the American population, they constitute too small a number in most surveys to be characterized separately. Because the sample sizes in the present survey are large in comparison to most, we have at least sufficient numbers of cases to consider publishing data on African Americans separately. Further, given the iterative nature of the series, we are also able to provide checks for the replication of findings on different samples each year. While there may be some risk that findings will be taken out of context or used carelessly in ways that might tend to increase racial misunderstandings, there is substantially greater risk that valuable information concerning the races (and relative to their well-being) would be lost if it were not included here.

A Note on the Questions about Amphetamine Use. Prior to the 1982 survey, we discovered that some respondents' answers to questions on amphetamine use erroneously included use of over-the-counter, stay-awake, and diet pills, as well as some "look-alike" pills. In the 1982 survey, we introduced some new questions on the use of amphetamines in order to make it clearer to the respondents that "look-alike" pills and over-the-counter products should be excluded. We also kept the old version of the questions in two questionnaire forms in the 1982 and 1983 surveys so that it would be possible to "splice" the trend lines resulting from the old and new questions. As a

*An extended analysis and discussion of African American–White differences may be found in Bachman and O'Malley (1984), Bachman, Wallace, O'Malley, Johnston, Kurth, and Neighbors (1991), Wallace, Bachman, O'Malley, Johnston, Schulenberg, and Cooper (2002), Wallace, Bachman, O'Malley, Schulenberg, Cooper, and Johnston (2003), and Wallace, Forman, Guthrie, Bachman, O'Malley, and Johnston (1999).

result of these changes, the reader who uses these volumes to examine trends in amphetamine use must be careful not to make inappropriate comparisons. The response distributions shown in the combined Forms 1–5 section (pages 28–29) from 1975 to 1981 contain the responses for Forms 1–5. For 1982 and 1983, that section contains two sets of responses. The first set is for Forms 1, 2, and 4 (with Form 1 double-weighted); these provide what we believe to be the best estimates of current amphetamine use and of trends from 1982 on. The second set of responses is based on Forms 3 and 5, the old versions of the questions; thus, these questions provide the best comparisons for looking at trends over time from 1975 to 1983 (although there is reason to be cautious about these trends because of the erroneous inclusion of nonamphetamines, as described above). Beginning in 1984, all forms used the new versions of the questions.

A Note on the Questions about Alcohol Use. In 1993, the question text was changed slightly in Forms 2, 5, and 6 to indicate that a "drink" meant "more than just a few sips." As a result of these changes, the reader who uses these volumes to examine trends in alcohol use must be careful not to make inappropriate comparisons. The response distributions shown in the combined forms section for 1975 to 1992 contain the responses for Forms 1–5 (through 1988) or 6 (beginning in 1989). For 1993, that section contains two sets of responses. The first set is for Forms 1, 3, and 4, the old versions of the questions; these questions provide the best comparisons for looking at trends over time from 1975 to 1993. The second set of responses is based on Forms 2, 5, and 6; these provide what we believe to be the best estimates of alcohol use and of trends from 1993 on. Beginning in 1994, all forms used the new versions of the questions.

A Note on the Questions about the Use of Hallucinogens Other Than LSD and Tranquilizers. In 2001, the questions on the use of hallucinogens other than LSD and tranquilizers were changed slightly in Forms 1, 3, and 5. For hallucinogens other than LSD, the term "other psychedelics" was replaced with "other hallucinogens" and "shrooms" was added to the list of examples. For the tranquilizer list of examples, Miltown was replaced with Xanax. In 2002, the questions in the remaining forms were also changed. The data presented in this volume are the revised data for all forms. Caution must be used when comparing data from 2001 to data from 2002 or when examining long-term trends. As with the revised alcohol questions, the set of old questions in the 2001 data (Forms 2, 4, and 6) are best used for the examination of trends over time from 1975 to 2001. The revised questions in 2001 (Forms 1, 3, and 5) and later are best used for the examination of trends from 2001 on. Beginning in 2002, all forms used the revised questions.

A Note on the Questions about the Use of Narcotics Other Than Heroin. In 2002, the questions on the use of narcotics other than heroin were revised in Forms 1, 2, and 4. The list of examples of narcotics other than heroin was updated: Talwin, laudanum, and paregoric—all of which had negligible rates of use by 2001—were replaced with Vicodin, OxyContin, and Percocet (and Percodan and Dilaudid in Form 1 only). In 2003, the question text in the remaining forms was also changed. Again, caution must be used in the comparison of trend data involving these revised questions.

Descriptive Results

Introduction to the Table Format and Conventions

Univariate and selected bivariate percentage distributions are given in this section for all questions asked of this year's senior class. The definitions of column headings and the source of the standard content for each table are given below under the numbers indicated in Figure 1.

Definitions of Column Headings

(1) **Questionnaire Form.** The form from which all data on the page were derived is given here. When the designation "Forms 1–6" is used, it indicates that responses from students completing all six questionnaires (or, in some cases, two or more of the questionnaires) have been combined; accordingly, the numbers of respondents in each column are six times as large as for questions contained in a single form only.

(2) **Total Sample.** Univariate percentage distributions based on the total sample of respondents are given in this column.

(3) **Sex.** Percentage distributions are given separately for males (M) and females (F). Respondents with missing data on the question asking the respondent's sex (question C03) are omitted from both groups.

(4) **Race.** Percentage distributions are given separately for those checking "White (Caucasian)" and *no other racial/ethnic group* (White) and for those checking "Black or African American" and *no other racial/ethnic group* (Black) in the changed version of the race/ethnicity question. Comparable columns for the other racial or ethnic groups (Mexican American or Chicano, Cuban American, Puerto Rican, other Hispanic or Latino, Asian American, American Indian or Alaska Native, or Native Hawaiian or other Pacific Islander) are not shown because of the low number of cases in each group. *Note:* See the caveats regarding the interpretation of racial differences and the changes to the race/ethnicity question in the Introduction section of this volume.

(5) **Region.** Percentage distributions are given separately for respondents living in each of four mutually exclusive regions of the country. The regional classifications are based on Census categories and are defined as follows:

Northeast (NE): Census classifications of New England and Middle Atlantic states; includes Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania.

North Central (NC): This is synonymous with the Midwest. The North Central (NC) abbreviation is used in the column headings. Census classifications of East North Central and West North Central states; includes Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas.

South (S): Census classifications of South Atlantic, East South Central, and West South Central states; includes Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas.

West (W): Census classifications of Mountain and Pacific states; includes Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and California.

(6) **Four-Year College Plans.** Percentage distributions are given separately for (1) respondents who indicate that they "definitely will" or "probably will" graduate from a four-year college program (Yes) and (2) those who say that they "definitely won't" or "probably won't"

graduate from a four-year college program (No), based on responses to question C21d. Respondents not answering question C21d are omitted from both columns. (A number of those who do not expect to complete a four-year college program *do* expect to get some post-secondary education, as may be seen in the tables for questions C21a and C21c.)

⑦**Illicit Drug Use: Lifetime.** Percentage distributions are given separately for five mutually exclusive subgroups differentiated by their degree of involvement with illicit drugs. Eligibility for each category is defined below.

None: This column contains data from those respondents who indicated that they had not used marijuana at any time and did not report use of any of the following illicit drugs in their lifetime: LSD, other psychedelics, cocaine, amphetamines, tranquilizers, methaqualone, barbiturates, heroin, or other narcotics.*

Marijuana Only: This column contains data from other respondents who indicated that they had used marijuana (or hashish) but had never used any of the other illicit drugs listed above.

Few Pills: This column contains data from those respondents who indicated having used one or more of the above listed drugs (other than marijuana) but who had not used any one class of them on three or more occasions *and* who had not used heroin at all.

More Pills: This column contains data from respondents who had used any of the above listed drugs (other than marijuana) on three or more occasions but who had never used heroin.

Any Heroin: This column contains data from those respondents who indicated having used heroin on one or more occasions in their lifetime.

⑧***N* (Weighted Number of Cases).** This row contains the number of students who turned in questionnaires in each of the categories indicated by the column headings. The number of cases is stated in terms of the weighted number of respondents rather than the actual number, since all percentages in the tables have been calculated using weighted cases. The actual number of respondents generally is about 15 percent higher than the weighted number for data collected in 1975, 1976, and 1977. (A comparison of weighted and unweighted numbers is provided in Table B-1 in Appendix B.) For data collected in 1978 or later, the actual number of respondents is roughly equal to the weighted number. Weighting is used to improve the accuracy of estimates by correcting for unequal probabilities of selection that arise in the multi-stage sampling procedures.

⑨**Percentage of Weighted Total.** This row indicates the percentage of the total number of respondents who fall into the category indicated by each column heading. Unlike all other percentages on the page, which can be summed vertically, these percentages sum horizontally. To the extent that the subcategories in a column (e.g., males and females) fail to sum to 100 percent, cases have been eliminated because of missing data on the variable in question (e.g., sex) or, in the case of race, because several subcategories have been omitted intentionally.

Table Contents

⑩ **Questions and Answers.** Each question along with its accompanying answer alternatives is presented verbatim. The alphanumeric prefix to the question indicates the section of the questionnaire in which it is located and its sequence within that section. So, for example, a prefix of B12c indicates that the item was question 12c in the B section of the questionnaire.

⑪ **Item Reference Number.** This is a unique identification number permanently assigned to each question. Any question may be located in the Question Index of the 1975–81 volumes by using this number and in the Question Index of all subsequent volumes by using this number in conjunction with the subject area code.

⑫ **Subject Area Code.** Every question has been classified into one or more subject areas; the alphanumeric code indicates the subject area (or areas) applicable to the question shown. The complete listing of subject areas is presented in Table 4 (at the beginning of the Question Index near the end of this volume). Starting with the 1982 volume, the Question Index is ordered first

*Inhalants (including the amyl and butyl nitrites) are not included in this list of illicit drugs because the relevant questions are not contained in all questionnaire forms or in all years of the study. Similarly, the use of PCP is counted only if it was reported under "other hallucinogens" use because specific questions about PCP are not included in all forms or years. This results in a few apparent inconsistencies in the tables relating the drug use index to specific questions about these drugs.

by subject area and then (within areas) by item reference number.

⑬ **Percentage Distribution.** Each column of numbers beside a question gives the percentage of each group (defined by the column heading) who chose each answer alternative, rounded to the nearest tenth of a percent. These figures add vertically to 100 percent (with some rounding error). Nonrespondents to the question are excluded from the percentage calculations.

⑭ **Number of Weighted Cases Answering (*N*).** The number of students in the relevant group (defined by the column heading) who answered the question is given just below the percentage distribution. The number of nonrespondents may be determined by subtracting this weighted number answering from the weighted number taking the questionnaire, shown at the top of the same column. Nonresponse may be due to the subject not answering the question, even though it pertains to him or her, or to the subject skipping inappropriate questions as instructed on a prior item.

The next major section of this questionnaire deals with various other drugs. There is a lot of talk these days about this subject, but very little accurate information. Therefore, we still have a lot to learn about the actual experiences and attitudes of people your age. We hope that you can answer all questions; but if you find one which you feel you cannot answer honestly, we would prefer that you leave it blank. Remember that your answers will be kept strictly confidential; they are never connected with your name or your class.																
B07: On how many occasions (if any) have you used marijuana (weed, pot) or hashish (hash, hash oil) . . .

B11: Amphetamines have been prescribed by doctors to help people lose weight or to give people more energy. They are sometimes called uppers, ups, speed, bennies, dexies, pep pills, and diet pills. Drugstores are not supposed to sell them without a prescription from a doctor. Amphetamines do NOT include any non-prescription drugs, such as over-the-counter diet pills (like Dexatrim) or stay-awake pills (like No-Doz), or any mail-order drugs.																
On how many occasions (if any) have you taken amphetamines on your own—that is, without a doctor telling you to take them . . .																

*=less than .05 percent.

In 2006 a slightly revised form of the steroid question was added to Form 5. An examination of the data did not show any effect from the wording change. In 2007 Forms 2 and 6 were changed in a like manner. Forms 2 and 6 had a slight wording change in 2008. An examination of the data did not show any effect from the wording change. The question text from Forms 2 and 6 and the combined data from all three forms are presented here.

The different questionnaire forms used in this study tend to emphasize somewhat different topics. The next major section in this form deals with alcohol and various other drugs. There is a lot of talk these days about these subjects, but very little accurate information. Therefore, we still have a lot to learn about the actual experiences and attitudes of people your age.

We hope that you can answer all questions; but if you find one which you feel you cannot answer honestly, we would prefer that you leave it blank.

Remember that your answers will be strictly confidential. We never connect them with your name or your class.

The next questions are about ALCOHOLIC BEVERAGES, including beer, wine, liquor, and any other beverage that contains alcohol.

B007: On how many occasions (if any) have you had any alcoholic beverage to drink—more than just a few sips . . .

†=excludes respondents for whom question was inappropriate.

B048: In addition to non-prescription diet and stay-awake pills, there are other stimulants and pep pills which can be sold legally in most states without a prescription—usually by mail. These are sometimes called "fake pep pills," "imitation speed," or "look-alikes," because they look like prescription amphetamines and sometimes have similar names. Other than the diet pills and stay-awake pills you have already told us about, on how many occasions (if any) have you taken other non-prescription stimulants or pep pills . . .

The next questions are about AMPHETAMINES, which doctors have prescribed to help people lose weight or to give people more energy. Drugstores are not supposed to sell them without a prescription from a doctor.																
Amphetamines are sometimes called: uppers, ups, speed, bennies, dexies, pep pills, diet pills, meth or crystal meth. They include the following drugs: Benzedrine, Dexedrine, Methedrine, Ritalin, Adderall, Concerta, Methamphetamine.																
IN YOUR ANSWERS ABOUT AMPHETAMINES, DO **NOT** INCLUDE ANY NON-PRESCRIPTION OR OVER-THE-COUNTER DRUGS.

The questions in the next column ask you to imagine different kinds of married life that you might have. We want you to think about different ways you might share responsibilities for working, taking care of the home, and taking care of the children. Please indicate how acceptable for you each of the different arrangements would be.

The next section of this questionnaire is about government and public affairs.																
A11: Some people think about what's going on in government very often, and others are not that interested. How much of an interest do you take in government and current events?																
1. No interest at all	8.8	8.1	8.8	7.3	11.2	7.8	9.2	9.5	8.1	6.8	17.8	7.9	8.9	7.6	9.2	45.0
2. Very little interest	18.2	13.9	21.8	18.3	17.6	17.9	20.7	17.2	17.4	16.6	23.9	18.4	19.0	19.0	16.4	10.0
3. Some interest	44.6	44.3	46.0	44.7	49.6	44.8	44.3	45.6	43.1	46.1	39.1	45.4	42.8	48.8	43.0	24.9
4. A lot of interest	19.7	23.2	17.3	20.5	15.8	19.7	18.9	18.4	22.8	21.4	13.0	19.8	21.5	19.5	19.5	9.3
5. A very great interest	8.6	10.5	6.1	9.1	5.7	9.7	6.9	9.3	8.6	9.1	6.1	8.5	7.8	5.1	12.0	10.7
Item 6330 Subject H01, Q08 N	*2367*	*1104*	*1119*	*1373*	*299*	*427*	*591*	*829*	*520*	*1865*	*357*	*1202*	*523*	*205*	*351*	*31*
A12: Do you think some of the people running the government are crooked or dishonest?																
1. Most of them are crooked or dishonest	22.4	21.6	23.1	21.2	26.5	26.5	22.9	22.1	18.9	20.8	29.2	20.8	23.8	19.8	27.5	32.2
2. Quite a few are	36.1	36.9	34.8	37.0	36.6	35.6	32.3	37.1	39.1	37.1	32.4	35.6	33.7	39.9	40.6	23.8
3. Some are	38.1	37.4	39.7	38.9	33.1	34.7	41.4	36.9	38.9	38.9	33.9	40.3	37.7	38.0	30.4	39.5
4. Hardly any are	3.0	3.6	2.3	2.7	3.1	2.9	2.6	3.6	2.8	3.0	3.4	2.9	4.1	2.2	1.4	2.7
5. None at all are crooked or dishonest	0.4	0.5	0.1	0.2	0.7	0.3	0.8	0.2	0.3	0.2	1.2	0.4	0.7	-	-	1.8
Item 6340 Subject H04, K01 N	*2364*	*1102*	*1117*	*1370*	*298*	*426*	*591*	*828*	*520*	*1863*	*355*	*1199*	*523*	*203*	*351*	*31*
A13: Do you think the government wastes much of the money we pay in taxes?																
1. Nearly all tax money is wasted	14.5	15.0	13.4	12.3	16.2	14.9	14.9	13.8	15.0	13.2	21.5	11.7	15.4	14.9	19.7	39.2
2. A lot of tax money is wasted	50.2	48.7	51.9	50.9	51.4	51.6	47.7	49.7	52.8	50.5	49.8	51.0	51.0	48.7	51.3	24.6
3. Some tax money is wasted	29.1	29.2	29.4	30.3	24.7	28.0	29.5	30.7	27.1	29.9	24.2	30.6	28.3	29.7	25.1	28.8
4. A little tax money wasted	5.3	6.2	4.5	5.7	5.9	4.2	6.9	5.1	4.4	5.7	3.4	5.9	4.9	5.6	2.6	5.6
5. No tax money is wasted	0.9	0.9	0.8	0.8	1.8	1.2	1.0	0.7	0.7	0.8	1.2	0.8	0.4	1.1	1.3	1.8
Item 6350 Subject H04, K01 N	*2356*	*1101*	*1110*	*1367*	*295*	*421*	*590*	*828*	*516*	*1855*	*355*	*1193*	*521*	*203*	*351*	*31*
A14: How much of the time do you think you can trust the government in Washington to do what is right?																
1. Almost always	3.9	3.6	3.9	4.4	2.3	2.5	4.5	4.3	3.8	3.9	3.3	4.8	3.2	1.9	2.1	11.5
2. Often	23.4	25.4	21.9	27.5	18.9	20.8	22.0	24.1	26.2	24.5	18.8	24.0	23.8	26.7	19.3	18.9
3. Sometimes	47.9	47.4	48.7	46.9	45.4	47.6	47.5	49.3	46.2	48.9	45.1	50.3	47.9	45.7	44.0	27.4
4. Seldom	18.5	16.0	20.7	16.2	24.6	20.3	20.3	16.4	18.3	17.7	21.7	15.8	19.1	21.8	24.8	26.9
5. Never	6.3	7.6	4.8	4.9	8.8	8.7	5.7	5.9	5.5	5.1	11.1	5.2	5.9	4.0	9.7	15.2

E06: Anabolic steroids are prescription drugs sometimes prescribed by doctors to treat certain conditions. Some athletes, and others, have used them to try to increase muscle development. On how many occasions (if any) have you taken steroids on your own—that is, without a doctor telling you to take them . . .

D08: The next questions are about drugs that doctors sometimes prescribe for people who have problems concentrating on one task at a time (attention deficit disorder), or with being too active or too disruptive (hyperactive), or both (ADHD). **Stimulant-type drugs** (i.e., amphetamine, methylphenidate, and pemoline) are prescribed for these conditions. These drugs include Ritalin, Adderall, Concerta, Metadate, Dexedrine, Focalin, Cylert, and others. Have you ever taken any of these stimulant-type prescription drugs under a doctor's supervision for these conditions? (Do **not** count drugs that are not stimulant-type, like Strattera, Wellbutrin, Provigil, Tenex, or Tofranil)

The next questions are about drugs that doctors sometimes prescribe for people who have problems concentrating on one task at a time (attention deficit disorder), or with being too active or too disruptive (hyperactive), or both (ADHD).																
Stimulant-type drugs (i.e., amphetamine, methylphenidate, and pemoline) are prescribed for these conditions. These drugs include Ritalin, Adderall, Concerta, Metadate, Dexedrine, Focalin, Cylert, and others.																
D03: Have you ever taken any of these stimulant-type prescription drugs under a doctor's supervision for these conditions? (Do **not** count drugs that are not stimulant-type, like Strattera, Wellbutrin, Provigil, Tenex, or Tofranil)																
1. No—GO TO QUESTION D06	91.5	89.7	93.0	89.6	96.6	90.5	92.8	90.3	92.6	92.6	86.6	95.0	93.6	90.0	80.6	61.4

E07: Steroids, or anabolic steroids, are prescription drugs sometimes prescribed by doctors to treat certain conditions. Some athletes, and others, have used them to try to increase muscle development.																
On how many occasions (if any) have you taken steroids on your own—that is, without a doctor telling you to take them. . .

D12: Anabolic steroids are prescription drugs sometimes prescribed by doctors to treat certain conditions. Some athletes, and others, have used them to try to increase muscle development. On how many occasions (if any) have you taken steroids on your own—that is, without a doctor telling you to take them . . .

Cross-Time Index of Questionnaire Items, 1976–2008

Introduction to the Indexing Conventions

Beginning with the 1982 volume, the cross-time index of question locations is organized first by subject area (see Table 4 for a complete listing). Within each subject area, questions are listed in numerical sequence according to item reference number, which is the unique numerical identifier assigned to each question in the study.

The Question Index may be used in two major ways:

1. **Locating a Question across Years.** Having located a question of interest in the Descriptive Results section, the reader may determine in what other years that same question has appeared by simply looking it up by subject area and item reference number. The index will show all years in which that item has appeared and also its location each year (by questionnaire form, section, and item number). All items will retain their unique reference numbers in future years as well and, thus, may be located in exactly the same way in subsequent volumes in this series. The 1975 index entries are not included in this volume but may be found in any volume prior to the 1997 volume.
   Example: A reader interested in a particular item about the nation finding technological solutions to problems would note that it has been classified under subject area I01 ("Expectations concerning societal change") and that it has been assigned item reference number 10940. The index entry for item 10940 shows that this item has appeared in Section D of questionnaire Form 4 in all annual surveys in the series. Its question number was D03c in 1976–81, D10c in 1982–2004, and D12c thereafter.

2. **Locating Questions by Subject Area.** Given an interest in some particular subject area, one can quickly scan the index to locate all questions dealing with that area. Table 4 lists all the subject areas into which items are classified, along with the alphanumeric code assigned to each area.
   Example: A reader interested in items dealing with religion should first locate the relevant code in Table 4: Code G, "Religion." The second step is to scan that section of the item index, noting for every item its item reference number and page location in this volume. The reader may or may not find the abbreviated description of the item (given in the third column of the index and further described below) helpful in deciding whether to look up a particular item in the Descriptive Results section. Some of these descriptions are rather clear as to their meaning, but others are less so.

Definitions of Column Headings

The definitions of column headings, and the conventions used for the entries in each column, are given below under the number indicated in the following key.

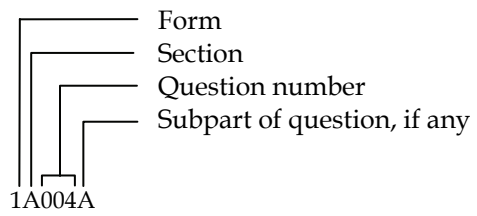
(1) **Item Reference Number.** A unique identification number is assigned to each question for the duration of this research and reporting series. It appears below that question in the Descriptive Results section, as well as in this index and the indices of all other volumes in this series.

(2) **Page Location.** The second column of the Question Index gives the page number of the present volume on which a verbatim statement of the question may be found along with this year's descriptive results. For drug use questions

appearing in the combined Forms 1–6 section, the page number given for the Form 1 question is the location of the question in Form 1 only. The page number given for the Form 2–6 question is the location of the question in the combined Forms 1-6 section. Table 3 in the Introduction to this volume lists all drug use questions by the form(s) in which they appear.

③ **Item Description (Abbreviated).** This is a brief mnemonic description—up to 16 characters in length—that attempts to characterize the content of the question. Originally developed for question identification on OSIRIS computer files, it may in many cases allow one to determine the relevance of the question to one's own interest and thus reduce the number of irrelevant questions that must be looked up in the Descriptive Results section.

④ **Questionnaire Location by Year.** An entry is provided for every year in which an item appeared in one of the study's questionnaire forms. The six (or fewer) characters constituting the entry indicate the form in which the question appeared, the section of that form, and the question number. Take as an example the questionnaire location 1A004A. This location code indicates that the question appeared in Form 1, Section A and was labeled as question 4a.



Occasionally an entry will be followed by an asterisk (*). This indicates that there was a change (usually minor) in the wording of the question and/or the answer alternatives in that year.

⑤ **Subject Area.** Table 4 shows the subject content areas that have been distinguished here and gives the alphanumeric code assigned to each of them. Every question item in the index has been classified into (and listed under) one or more of the subject areas, and the index (beginning with the 1982 volume) has been organized by subject area.

Table 4
Subject Area Key
(Referenced by Letter in the Question Index)

A. Drugs. Drug use and related attitudes and beliefs, drug availability and exposure, surrounding conditions and social meaning of drug use. Views of significant others regarding drugs. 262

A01... Use of Various Licit and Illicit Drugs.....262
A01a. . . . in lifetime.....262
A01b. . . . in last 12 months.....264
A01c. . . . in last 30 days.....268
A01d. Quantity used 270
A01e. How high? (How often?).....272
A01f. How long high? 272
A01g. Incidence of first use 272
A01h. Use with other drugs 274
A01i. Tried to stop 276
A01j. Use on doctor's orders? 276
A01k. Bad trip? 276
A01l. Kinds of drugs 276
A01m. Cost.....278
A01n. Source.....278

A02. Exposure to Drug Use 280
A02a. Friends' use 280
A02b. Exposure to users 280
A02c. Exposure through the media 282

A03. Availability of Drugs.....282
A03a. Availability 282
A03b. Purchase.....282

A04. Expected Future Use.....282
A04a. Expected future use among all respondents 282
A04b. Expected future use among nonusers.....284

A05. Conditions of Use 284
A05a. Alone.....284
A05b. With others.....284
A05c. Settings of use (at school, at home, etc.).....284
A05d. Mode of drug administration 286

A06. Reasons for Use, Abstention, and Stopping.....286
A06a. Reasons for use.....286
A06b. Reasons for abstention from or stopping drug use 290
A06c. Worries about the consequences of quitting 292

A07. Drug Problems 292
A07a. Driving, tickets, and accidents after use 292
A07b. Other problems 292

A08a. Sources of Help, Treatment Regarding Drugs.....294

A09. Others' Awareness of Use.....294
A09a. Parental awareness of use 294
A09b. Others' awareness of use.....294
A09c. Police awareness of use 294

Table 4 (continued)

A10. Drug Education and Communication....294
A10a. In school....294
A10b. In the mass media....296

A11. Own Attitudes Regarding Drugs and Drug Users....296
A11a. Own attitudes about use by adults....296
A11b. Own attitudes regarding drugs for own children....298
A11c. Own perceptions of users....298
A11d. Own attitudes about use by people of high school age....298

A12. Others' Attitudes Regarding Drugs and Drug Users....298
A12a. Parents' attitudes regarding drugs....298
A12b. Friends' and fellow students' attitudes regarding drugs....300
A12c. Perception of drug users....300

A13. Legal Issues Regarding Drugs....302
A13a. Preferred legality for adults....302
A13b. Own response to legalization....302
A13c. Knowledge of marijuana laws....302

A14. Risk of Drug Harm....302
A14a. To self....302
A14b. To others....304

A15a. Admitting Use in Questionnaire....304

A16a. Parent Groups....304

A17. Role Models in the Larger Environment....304
A17a. Perceived use of drugs by role models....304
A17b. Perceived attitudes toward drugs by role models....306

A18. Promotional Activities....306
A18a. Advertising....306
A18b. Logos....306
A18c. Coupons....306
A18d. Free samples....306
A18e. Movies or television....306

B. Education....306

B01. High school: scholastic status, objectives, experiences....306

B02. Combining work and school: attitudes, experiences....308

B03. Interracial contact at school....310

B04. Student norms, misbehavior in class....310

B05. Counseling....310

B06. Absenteeism and truancy....310

B07. Delinquency, victimization, and feeling safe at school....310

B08. Competency testing....312

B09. Post-high school: status, plans, characteristics....312

B10. Attitudes regarding educational institutions....314

B11. High school: length of experiences....314

Table 4 (continued)

C. Work and Leisure. 314
C01. Present or recent work experience....314
C02. Income sources; financial security....316
C03. Vocational plans, aspirations, expectations....316
C04. Preferences regarding job characteristics 316
C05. Desirability of different working arrangements and settings....318
C06. Work ethic/success orientation 318
C07. Leisure time: extent, activities....318
C08. Attitudes toward leisure time 320
C09. Computer use 320

D. Sex Roles and Family. 320
D01. Dating and marriage: status, attitudes, expectations....320
D02. Parenthood: status, attitudes, expectations....322
D03. Values surrounding marriage and family 322
D04. Preferences regarding marital/familial arrangements....322
D05. Sex role attitudes....322
D06. Opinions regarding gender discrimination....324

E. Population Concerns. 324
E01. Overpopulation....324
E02. Birth control....324

F. Conservation, Materialism, Equity, etc. 324
F01. Personal materialism 324
F02. Societal materialism and advertising 326
F03. Concern with world hunger and poverty 326
F04. Ecological concerns....326
F05. Concern with conservation of resources....326
F06. Preferences regarding dwelling type and urbanicity 326
F07. Driving and use of mass transit 328

G. **Religion.** Religious preferences, activities, views....328

Table 4 (continued)

H. Politics. 328
H01. Political interest and preferences 328
H02. Attitudes toward governmental policies and practices 328
H03. Views about the role of citizens in government (see also I02) 330
H04. Confidence in government 330
H05. Voting, political activism 330

I. Social Change. 330
I01. Expectations concerning societal change 330
I02. Attitudes regarding activism 330
I03. Reactions to personal and social change 332

J. Social Problems. Interest and concerns. 332

K. Major Social Institutions. 332
K01. Trust (see also C05) 332
K02. Satisfaction with performance 332
K03. Preferred influence 334

L. Military. 334
L01. Plans for military service 334
L02. Attitudes toward a draft 334
L03. Views about the use of military force 334
L04. Attitudes toward the military as an institution and occupation 334

M. Interpersonal Relationships. 336
M01. Dating 336
M02. Cross-age relationships with adults outside the family (see also B05) 336
M03. Agreement/disagreement with parents 336
M04. Friendships (see also Q03) 336
M05. Community at large 336

N. Race Relations. 338
N01. Preferred interracial contact 338
N02. Attitudes toward discrimination 338
N03. Actual interracial contacts 338

Table 4 (continued)

O. Concern for Others. 338
O01. Attitudes regarding social service, charitable activism 338
O02. Involvement in community, altruistic activities 338
O03. Concern with the problems of others 338

P. Happiness. 340
P01. Happiness, satisfaction with life and self 340
P02. Satisfaction with specific life domains 340

Q. Other Personality Variables. 340
Q01. Attitudes about self, self-esteem 340
Q02. Locus of control 342
Q03. Loneliness 342
Q04. Risk taking 342
Q05. Trust in others 342
Q06. (Changed to subject areas T01–T04) 350
Q07. Importance placed on various life goals 342
Q08. Social, political, cultural orientation 342
Q09. Hostility 344
Q10. Boredom 344

R. Background. 344
R01. Age, sex, race, and marital status 344
R02. Family characteristics 346
R03. Living arrangements and household characteristics 346

S. Deviance and Victimization. 348
S01. Delinquent behaviors 348
S02. Driving violations and accidents 348
S03. Victimization experiences 350

T. Health 350
T01. Symptoms 350
T02. Habits 352
T03. Height and weight 352
T04. Medical treatment 352

The Question Index begins on the following page.

Appendix A
Sampling Error Estimates and Tables*

All of the percentages reported in this volume are really *estimates* of the response percentages that would have been obtained if, instead of using a sample survey, we had asked all high schools throughout the United States to participate and in all schools that agreed to participate we had invited the whole senior class to fill out the questionnaires. The question naturally arises: How accurate are the present percentage estimates based on a limited number of schools and seniors? For any particular percentage resulting from a sample survey we cannot know exactly how much error has resulted from sampling, but we can make reasonably good estimates of "confidence intervals"—ranges within which the "true" population value is very likely to fall. The word "true" in this context is defined quite narrowly; it refers only to the value that would be found if we had set out to survey the total population—all high school seniors in the United States. Thus, this concept of "true" population value does *not* take account of biases that might occur due to refusals, distortion of responses, faulty question wording, and other factors. Each of these sources of possible error is discussed in the "Representativeness and Validity" section of the Introduction to this volume. The reader is urged to review this material and take it into account along with the sampling error estimates included in this appendix.

The estimation of confidence intervals in surveys involving complex samples can be a highly complicated combination of statistical science plus informed judgment. It is an area in which there is no single "right answer" or "best approach." We suspect that many of those using this volume will not be especially interested in *how* we have chosen to solve the problems involved in estimating confidence intervals, so long as we provide guidelines that can be applied in a fairly simple and straightforward manner. This appendix is designed to accomplish that. Appendix B provides a more extensive discussion of how we obtained the confidence intervals shown here, and it also provides guidelines for computing specific confidence intervals for a wider range of possible applications than can be covered in the tables provided in this appendix.

A very rough example of a confidence interval can be stated in these terms: for percentages based on the total sample (all five questionnaire forms), the "true" values are rarely more than 1.5 percent higher or lower than the percentage estimates reported in this volume. How rarely? The chances are much lower than 1 in 20. Indeed, many of the percentages reported for the total sample are accurate to within 1 percent.

Of course, most of the data reported here are based on items included only in one or another of the five questionnaire forms. Since such percentages are based on only one-fifth of the total sample, they are somewhat less accurate. The loss in accuracy is less than might be imagined, however, for reasons spelled out in Appendix B. For present purposes, it is enough to say that percentages based on 3,000 or more seniors responding to one questionnaire form are rarely (less than 1 in 20) farther than 2.4 percent away from the "true" value.

We have thus far provided two very rough illustrations of confidence intervals—a range of ±1.5 percent for percentages based on the total sample and a range of ±2.4 percent for percentages based on the number of seniors responding to one questionnaire form. While these two intervals

*Appendixes A and B, which discuss estimates of sampling errors and design effects, were written when there were five questionnaire forms used in each annual survey; a sixth form was added beginning in 1989. Because we believe that there would be very little change in estimates of sampling errors, or in design effects, we have not revised these appendixes to reflect the added form.

provide some notion of the overall range of accuracy of the sample, they fall short of our needs in a number of respects. We need to be able to assign confidence intervals for subgroups such as males, females, those who plan to complete college, and so forth, all of which involve smaller numbers of cases and, thus, some reduction in accuracy. We also need to take account of the fact that, other things being equal, confidence intervals grow smaller when one moves from the middle of the scale (percentages near 50 percent) to the extremes (e.g., 4 percent or 96 percent). Further, we need to provide guidelines for evaluating the difference between two percentages: for example, we may wish to know whether an increase in the percentage of daily marijuana users from one year to the next is large enough to be considered a statistically significant change.

Each of the requirements mentioned above is taken into account in the tables of confidence intervals that follow.

Confidence Intervals for Single Percentages

Table A-1 provides confidence intervals for single percentages that are reasonably good approximations for most *variables* and for most *subgroups* (as well as for the total sample). The table entries slightly underestimate the confidence intervals for regional subgroups and for blacks. These underestimates can be corrected reasonably well by multiplying the entries in Table A-1 by a factor of 1.1 for data based on a single form and by a factor of 1.33 for data based on all five forms. A more serious problem is that the table entries substantially underestimate the confidence intervals for certain variables that tend to be somewhat homogeneous within schools, as well as other factors likely to show clustering according to geographical area or socioeconomic level. A discussion of some of these variables is provided at the end of this appendix.

Table A-1 accommodates various numbers of cases (presented as different columns in the table) and various percentages (presented as different rows in the table). The table entries, when added to and subtracted from the observed percentage, establish the 95 percent confidence interval (calculated as 1.96 sampling errors). Thus, for example, to determine the accuracy of a result of 67.4 percent based on a sample of 1,632 cases, one should first look for the closest values in the table (in this case, about 70 percent and a number of cases approximately equal to 1,500); next, determine the values to be added to and subtracted from the observed percentage (in this case, the values would be +2.8 percent and -2.9 percent); and then compute the confidence interval around the observed percentage of 67.4 percent (in this case, an interval ranging from 64.5 percent to 70.2 percent). This procedure yields an interval such that, for most variables, the chances are 95 in 100 that, if all high school seniors in the country had been asked to participate in the survey, the resulting percentage would fall within the interval.

Confidence Intervals for Differences between Two Percentages

Table A-2 provides confidence intervals for differences between certain percentages. Specifically, the table can be used for *comparisons* between males and females, between those who do and do not plan to complete four years of college, and between those falling into different categories of the five-level index of drug usage. The above comparisons are appropriate for data from any single year (e.g., male seniors in 1976 compared with female seniors in 1976 or the "marijuana only" seniors in 1977 compared with the "no illicit drugs" seniors in 1977). Table A-2 is also useful in assessing *one-year* trends for any of the above subgroups as well as for the total sample. For example, one may be interested in a confidence interval (or significance level) for the difference between the percentage of female seniors in 1977 who used marijuana and the percentage of female seniors in 1978 who did so. The values in Table A-2 are appropriate for confidence intervals across adjacent years (e.g., 1976 compared with 1977), provided the same subgroup (e.g., females) is being considered both years. The confidence intervals for comparisons across nonadjacent years (e.g., 1976 compared with 1978) are slightly larger.

With appropriate corrections, the entries in Table A-2 can be used for trends covering more than one year and for trends or comparisons involving regional subgroups and blacks. Each of these applications requires some upward adjustment of the table entries; guidelines for such adjustments are provided in the notes accompanying Table A-2.

For information on the derivation of Table A-2 and for guidelines to be used in computing confidence intervals not covered in that table, the

reader is referred to Appendix B.

In order to find the appropriate confidence interval in Table A-2, one must first locate that portion of the table that deals with percentage values closest to the two percentages being compared (for example, if one wished to compare a value of 28.1 percent with one of 35.4 percent, the "p = 30 percent or 70 percent" portion of the table would be closest). The next step is to locate the specific table entry that corresponds most closely to the numbers of cases involved in the two percentages being compared (e.g., if those numbers were 1,478 and 1,563 for 28.1 percent and 35.4 percent, the correct table entry would be 3.9 percent). That table entry, when added to and subtracted from the difference between the two percentages, yields the 95 percent confidence interval for the difference. (In the above illustration, that would be 7.3 percent ±3.9 percent, or an interval from 3.4 percent to 11.2 percent.) The chances are only 1 in 20 that the "true" difference between two percentages lies outside of this interval.

Another use of Table A-2 is to test whether a difference between two percentages is "statistically significant." If the table entry is smaller than the difference between the two percentages (as is true in the above illustration), then the difference is statistically significant at the 95 percent level (sometimes indicated as $p < .05$).

Some Cautions

The tables provided here are based on averages of large numbers of sampling errors computed across a wide range of the variables that appear in this volume, as well as across all of the subgroups for which data are reported here. We are confident that the values in the tables are reasonably accurate for most purposes, but we must repeat the caution that the tables slightly underestimate confidence intervals for the following groups and comparisons:

Blacks
Regions (Northeast, North Central, South, West)
Comparisons among regions
Comparisons across nonadjacent years
(e.g., 1976 vs. 1978)

A more important problem is that the tables substantially underestimate the confidence intervals for certain variables that, for various reasons, show greater than average homogeneity within schools. After an extensive, but by no means exhaustive, sampling of the kinds of variables that might show such clustering by school, we can provide the following examples of the kinds of variables for which Tables A-1 and A-2 substantially underestimate the confidence intervals.

Variables Related to Educational Background and Aspirations. The questionnaire items dealing with father's education, mother's education, high school curriculum (college preparatory vs. all others), and plans for completing four years of college all show an appreciable amount of clustering by school. Accordingly, for such variables the confidence intervals provided in the tables should be doubled.

Other items dealing with plans for technical/vocational schooling, a two-year college program, or graduate/professional study also require adjustment. The confidence intervals in the tables should be multiplied by a factor of 1.5 in order to be applicable to these variables.

It seems clear that the common factor underlying these particular variables is the tendency for family socioeconomic level to be somewhat homogeneous within school districts—some schools serve wealthier populations than do others. That makes the form of sampling we use somewhat less efficient for measuring those variables (such as those listed above) that are closely associated with family socioeconomic level. Therefore, we urge the reader to treat with caution any variables that are likely to be strongly linked to socioeconomic factors. In the absence of more specific computations of sampling errors, a good rule of thumb for dealing with such variables would be to double the confidence intervals provided in Tables A-1 and A-2.

Variables Related to Geographic Location. Another category of variables that are somewhat homogeneous within schools and school districts consists of those things that reflect differences in region and/or urbanicity. An obvious example is a background question asking where the respondent grew up: the response category on a "farm" shows a very high degree of clustering within schools. One would have to more than double the confidence intervals in the tables to deal with such a measure. Similarly, high clustering was found for some responses about religious preference; for example, those whose preference is Baptist are located primarily in the South (and probably heavily in rural areas), whereas those whose preference is Jewish are located primarily in the

Northeast (especially in larger cities). The confidence intervals in Tables A-1 and A-2 should be multiplied by a factor as large as 3 in order to be applicable to such variables.

Other variables that show some greater than average homogeneity within schools include such ideologically related dimensions as frequency of attending religious services, importance of religion, and political preference. Still other variables showing high homogeneity, probably because of their association with urbanicity, include driving (percentage who do not drive at all), working (percentage with no job), and household composition (percentage with father not living in the home). For each of the variables mentioned in this paragraph, the confidence intervals in Tables A-1 and A-2 should be multiplied by a factor of about 1.5.

Variables Involving Use of Alcohol and Marijuana. Extensive work has been done to compute sampling errors and confidence intervals for the drug use measures included in this volume (see Johnston, Bachman, and O'Malley, 1977, 1979, 1982; Johnston, O'Malley, and Bachman, 1984, especially Appendix B). Most drug use variables show sampling errors that lie within the range of those provided in Tables A-1 and A-2. Usage levels for alcohol and marijuana, however, show some degree of homogeneity within schools, thus requiring that the table levels be adjusted. For items dealing with alcohol use, the entries in Table A-1 should be multiplied by a factor of 1.6; for items dealing with marijuana use, the correction factor is 1.35.

As noted earlier, this appendix has presented guidelines for using the tables of confidence intervals provided herein. Those readers interested in learning more about the rationale underlying such tables, the procedures used to derive the particular tables presented here, and guidelines for further computations of confidence intervals may consult Appendix B of this volume.

Notes to Table A-1

Caution: The entries in this table systematically underestimate confidence intervals for regional subgroups and for blacks. In order to correct these underestimates, the table entries should be multiplied by a factor of 1.1 for data from a single form and by a factor of 1.33 for data based on five forms. Further cautions and corrections are required for some specific variables that relate educational background and aspirations, geographic location, and the use of alcohol and marijuana (see discussion in the final sections of Appendix A).

The values in this table, when added to and subtracted from an observed percentage, establish the 95 percent confidence interval around that percentage, incorporating a design effect. Table values were calculated using the following formula (adapted from Hays, 1973, p. 379):

$$\textit{lower limit} = p - \frac{2N'p + (1.96)^2 - 1.96\sqrt{4N'p(1-p) + (1.96)^2}}{2[N' + (1.96)^2]}$$

$$\textit{upper limit} = \frac{2N'p + (1.96)^2 + 1.96\sqrt{4N'p(1-p) + (1.96)^2}}{2[N' + (1.96)^2]} - p$$

where p = the proportion, N' is the "effective N," and $N' = N/(1.3 + 0.00015N)$.
(See Appendix B for a discussion of the concept of "effective N.")

Table A-1

Notes to Table A-2

The entries in this table (which appear on the next four pages) are appropriate for *comparisons* between (a) males and females, (b) those who do and do not plan four years of college, and (c) those falling into different categories of the five-level index of drug usage. The table entries are also appropriate for *one-year trends* for the total sample and any of the subgroups except region. Most other trends and subgroup comparisons require that the table entries be multiplied by an adjustment factor, given below.

Outline of Steps to Follow (see text of appendix for illustrations)

1. Locate the portion of the table with "*p*" values closest to the two percentages being compared.

2. Locate the specific entry closest to the weighted *N*s for the two percentages.

3. Multiply that entry by any necessary adjustment factor (see below).

4. That table value (or adjusted table value), when added to and subtracted from the difference between the two percentages, yields the 95 percent confidence interval for the difference.

5. Also, if the table value (or adjusted table value) is smaller than the difference between the two percentages, then the difference may be described as "statistically significant at the 95 percent level."

Adjustment Factors	Adjustment Factor (to be multiplied by table entry)
For comparisons between blacks and whites	
based on single-form data	*
based on five-form data	1.25
For comparisons between any two regions	
based on single-form data	1.15
based on five-form data	1.50
For one-year trends involving any region	
based on single-form data	*
based on five-form data	1.25
For trends over two or more years involving any region	
based on single-form data	*
based on five-form data	1.35
For trends over two or more years involving all other groups	
based on single-form data	*
based on five-form data	1.15

*Indicates that no adjustment is necessary for category shown.

Note: The table entries were calculated using the following formula: $1.96\sqrt{p(1-p)\frac{1}{N'_1}+\frac{1}{N'_2}}$

where $N'_1 = N_1/\text{DEFF}$, $N'_2 = N_2/\text{DEFF}$, and $\text{DEFF} = 1.3 + 0.000075\left[\frac{N_1 N_2}{(N_1+N_2)}\right]$

Appendix B
Procedures Used to Derive Design Effects and Sampling Errors*

Appendix A provided a very brief and relatively nontechnical explanation of sampling error estimates, accompanied by two tables of confidence intervals that can be used to ascertain the accuracy of most percentages reported in this volume. The present appendix is intended to provide some background concerning the strategy and rationale involved in computing these confidence intervals. It also offers guidance for those wishing to make sampling computations beyond those contained in Appendix A.

This appendix, like the first, is intended to be readable and usable by the nonstatistician. For that reason, we take the time to outline (albeit briefly) a number of relatively elementary factors involved in estimating confidence intervals.

Factors Influencing the Size of Confidence Intervals

The most straightforward types of samples, from a statistical standpoint at least, are simple random samples. In such samples the confidence limits for a proportion are influenced by the size of the sample or subgroups being considered and also by the size of the proportion. For example, the 95 percent confidence interval for a proportion p based on a simple random sample of N cases is approximated by: $p \pm 1.96\sqrt{p(1-p)/N}$. In a complex probability sample such as the present one, there are a number of other factors that influence the size of confidence limits. This section lists all of the factors that have been taken into account in calculating confidence intervals for use with the data in this volume, beginning with the most simple factors and then proceeding to the more complex.

Number of Cases (*N*). Other things being equal, the larger a sample (or subgroup within a sample), the smaller or more precise will be the confidence interval for a percentage based on that sample. One of the factors determining the size of the confidence interval is $1/\sqrt{N}$. Thus, for example, if all other things were equal, a sample of 400 would have confidence intervals half as large (or twice as precise) as a sample of 100, because $1/\sqrt{400}$ is half as large as $1/\sqrt{100}$.

Size of Percentage. Other things being equal, percentage values around 50 percent have larger confidence intervals than higher or lower percentage values. This is because another of the factors determining the size of the confidence intervals is $\sqrt{p(1-p)}$, where p is a proportion ranging from 0 to 1.0 (or, to put it in percentage terms, the factor is $\sqrt{x\%(100-x\%)}$). Thus, for example, a proportion of either 0.1 or 0.9 (a percentage of either 10 percent or 90 percent) will have a confidence interval only three-fifths as large as the confidence interval around a proportion of 0.5 (or 50 percent), because $\sqrt{0.1(1-0.1)}$ is three-fifths as large as $\sqrt{0.5(1-0.5)}$.

Design Effects in Complex Samples. Under conditions of simple random sampling, a confidence interval can be determined solely on the basis of the number of cases and the percentage value involved. More complex samples such as the one used in the present study make use of stratification and clustering and often differential weighting of respondent scores, and these all influence sampling error. While stratification tends to heighten the precision of a sample, the effects of clustering and weighting reduce precision

*Appendixes A and B, which discuss estimates of sampling errors and design effects, were written when there were five questionnaire forms used in each annual survey; a sixth form was added beginning in 1989. Because we believe that there would be very little change in estimates of sampling errors, or in design effects, we have not revised these appendixes to reflect the added form.

(compared with a simple random sample of the same size). Therefore, it is not appropriate to apply the standard, simple random sampling formulas to such complex samples in order to obtain estimates of sampling errors, because they would almost always underestimate the actual sampling errors.

Methods exist for correcting for this underestimation, however. Kish (1965, p. 258) defines a correction term called the design effect (DEFF), where:

$$\text{DEFF} = \frac{\text{actual sampling variance}}{\text{expected sampling variance from a simple random sample with same number of elements}}$$

Thus, if the actual sampling variance in a complex sample is four times as large as the expected sampling variance from a simple random sample with the same number of cases, the DEFF is 4. Since confidence intervals are proportionate to the square root of variance, the confidence intervals for such a sample would be twice as large (because the square root of 4 is 2) as the confidence interval for a simple random sample with the same number of cases. A fairly simple and straightforward way of applying the concept of design effect may be to note that an increase in design effect has the same impact on precision as a reduction in the number of cases in a simple random sample. For example, a sample of 16,000 cases with a design effect of 4 would have the same degree of precision (the same size confidence intervals around various percentages) as a simple random sample of 4,000.

In principle, every different statistic resulting from a complex sample can have its own design effect, and different statistics in the same sample may have quite different design effects. However, it is not feasible to compute every design effect, nor would it be feasible to report every one. Thus, in practice, design effects are averaged across a number of statistics and these average values are used to determine the design effects for other statistics based on the sample. Sometimes a single design effect is applied to all statistics of a given type (e.g., percentages) for a given sample. In the present study, however, a rather extensive exploration of design effects revealed a number of systematic differences. These systematic differences have to do with the particular measures being examined, the subgroups involved, and the question of whether a trend over time is being considered. The most consistent difference involves the number of cases in the group or subgroup for which the design effect is computed.

The Relationship between Subgroup Size and Design Effects. Kish, Groves, and Krotki (1976) have observed that design effects tend to be smaller for subgroups than for total samples; moreover, the smaller the subgroup, the smaller the design effect is likely to be. The explanation for this widespread phenom-enon is that the average number of cases in each sampling cluster is an important factor in determining the size of the design effect; and as subgroup size decreases, so does this average number of cases per cluster. This point is illustrated by several subgroups treated in the present volume—males, females, those planning four years of college, and those not planning four years of college. All (or virtually all) of the schools in the sample have both male and female students, as well as some students who plan four years of college and others who do not. Thus, each of these four subgroups is spread more or less evenly across the full number of clusters (schools). Since each of these subgroups includes roughly half of the total sample, the average number of cases per cluster is about half as large as for the total sample, and this leads to a smaller design effect than is found for the total sample. Other subgroups involving different patterns of drug use are also distributed more or less evenly across all clusters and thus are subject to the same phenomenon of smaller design effects because of the smaller number of cases per cluster.

One very important exception to the pattern of smaller design effects for subgroups involves the four geographic region subgroups presented in this volume. These subgroups do not cut across all clusters; instead, regions have been described as "segregated" subgroups, in contrast to the "cross-class" subgroups discussed above. For such segregated subgroups, the average number of cases per cluster is about the same as is found in the total sample, and thus the design effects are not lower than those for the total sample (Kish et al., 1976). Another subgroup that is in some respects similar to regional subgroups is the category of blacks. Black respondents are not found equally across high schools throughout the United States. There are, of course, regional differences in proportions of blacks, and these contribute substantially to this lack of equal distribution. In addition, there are patterns of segregation in housing that continue to be reflected in the unequal distribution of blacks in

high schools. The net effect of these several factors is that the black subgroup in our sample is "partially segregated" in a sampling sense as well as in the more usual usage of that word. For that reason, the design effects for blacks are somewhat larger than for other subgroups of approximately similar size.

Because the subgroups consisting of blacks and the four regional groups all have larger design effects than do other subgroups of the same size, it is necessary to adjust the confidence intervals for these subgroups as indicated in Appendix A. (At a later point in the present appendix we will say more about these adjustment factors.)

One other kind of "subgroup" must be noted in this discussion of the relationship between subgroup size and design effects. One-fifth of the total sample filled out each of the five separate questionnaire forms, and thus the respondents to each of these forms may be viewed as a "cross-class" subgroup of the total sample. The average cluster size for a single form is exactly 20 percent of the average cluster size for the total sample. That means, of course, that the single-form samples (which are the basis for the large majority of the data presented in this volume) are distinctly more "efficient" than the sample based on all five forms. Accordingly, single-form data have much smaller design effects (as displayed later in this appendix).

Design Effects for Comparisons between Subgroups. We noted above that a number of subgroups treated in this volume can be described as "cross-class" subgroups, meaning that members of the subgroup are distributed more or less evenly across sampling clusters. For these kinds of subgroups, it turns out that *comparisons* are relatively efficient, from a sampling standpoint. The technical explanation for this phenomenon is that there is a higher degree of covariance between such subgroup pairs than would be the case in a comparison of independent subgroups. Now let us offer a fairly nontechnical illustration to indicate why this is so. Suppose that a researcher interested in the use of marijuana during the senior year of high school obtained data from five high schools concerning female seniors' marijuana use and data from five other high schools concerning male seniors' marijuana use. Suppose that the percentage values for marijuana use during senior year were as follows:

Female seniors (five schools):
60%, 20%, 65%, 30%, 50%

Male seniors (five other schools):
40%, 80%, 25%, 70%, 60%

Even though there is a difference of 10 percentage points between males and females (if the five schools in each case are averaged), there is still so much variability among schools that one would not conclude with very much confidence that females in general are less likely than males to use marijuana during the senior year of high school. Suppose, on the other hand, that the researcher had obtained data from a total of only five schools and had obtained data concerning both male and female seniors in each school as follows:

	Females	Males
School A	60%	70%
School B	20%	25%
School C	65%	80%
School D	30%	40%
School E	50%	60%

The same group of percentages, this time based on five pairings of males and females rather than independent observations, are much more strongly suggestive of systematic differences between the sexes.

A process analogous to that illustrated above is involved when "cross-class" subgroups are compared, and the increased accuracy or sampling efficiency is reflected in relatively small sampling errors and design effects.

Design Effects for Trends. Thus far this discussion of factors influencing design effects and confidence intervals has focused only on groups and subgroups within a single year. But one of the central purposes of the Monitoring the Future project is to monitor trends over time; indeed, the study procedures have been standardized across years insofar as possible in order to provide the opportunity for sensitive measurement of change. One of the factors designed to produce an added degree of consistency from one year to the next is the use of each school for two data collections, which means that for any two successive years half of the sample of schools is the same. This, plus the fact that the other half of the school sample in a given year is from the same primary sampling units as the half sample it replaced, means that there is a good deal of consistency in the sampling and clustering of the sample from one year to the next. As a result, when cross-year comparisons are made (say, between 1976 and 1977), the design effects are appreciably smaller (i.e., the efficiency is greater) than if completely independent samples of schools

had been drawn each year. In other words, the 1976 and 1977 samples are not independent; on the contrary, there is a considerable degree of covariance between them. A similar level of covariance occurs between any pair of adjacent-year samples (e.g., 1977 and 1978), because about half of the schools in both samples were the same. This covariance, or partial "matching," reduces the design effect for differences observed between adjacent years, compared to what they would have been with totally independent samples.

It follows from the discussion above that a trend over an interval greater than one year (e.g., a comparison between 1976 and 1978, which involves totally nonoverlapping school samples) is likely to have a design effect that is larger than that for a comparison between adjacent-year samples.

Variables with Unusually Large Design Effects. Kish et al. (1976) stress the importance of computing sampling errors for many kinds of variables, and they point out that they have found "very wide ranges in values of sampling errors (standard errors and design effects) between diverse variables within the same survey" (p. 21). Our own experience has been that, among most variables, the variation in sampling errors and design effects seems more random than consistent, and thus we are reasonably comfortable with the use of averaging procedures (described below) in order to derive a set of general purpose tables. There are some important exceptions to the above generalization, however. Variables that are likely to be grouped according to geographical area (region and/or urbanicity), as well as variables that may differ systematically from one school to another, show much higher than usual amounts of homogeneity within sample clusters. It follows necessarily that such variables also have much higher than usual design effects. The variables in the Monitoring the Future study that seem most likely to show such high design effects tend to be grouped into the questionnaire segment dealing with background factors and educational aspirations (Section C of all questionnaire forms). These variables were excluded from the process of computing overall design effects and the confidence intervals provided in Tables A-1 and A-2. Appendix A provides a further discussion of some of these variables and offers some suggestions for adjusting the confidence interval tables to deal with them.

Procedures Used in Deriving Design Effects and Tables of Confidence Intervals

Having taken some pains to review the several factors that can influence design effects and confidence intervals, it is now a fairly simple matter for us to summarize the steps followed to compute the tables of confidence intervals shown in Appendix A. We were heavily influenced in this effort by the work of Kish and his colleagues (Kish, 1965; Kish et al., 1976) in two ways. First, we followed their recommendation that sampling errors be computed and averaged across a goodly number of variables and subgroups. Second, we paid particular attention to their observation that design effects tend to be smaller for subgroups than for total samples (a point discussed earlier in this appendix).

Confidence Intervals for Single Percentages. Our procedure was to compute sampling errors and design effects for most of the variables that are common to all five forms (those in the C sections of all questionnaires and those in the B sections of Forms 2 through 5) and for every twentieth variable in the A, D, and E sections. (Form 1 was omitted because most of this form comprises drug-related items, and such items involve high proportions of missing data because respondents are instructed to skip over many questions that are not applicable to them.) Design effects were computed for each of the subgroups reported in this volume, as well as for the total sample. Design effects for each subgroup and for the total were averaged across variables for the C section material (all five forms), the B section material (drug use measures, all four forms), and the sampling of variables from the A, D, and E sections (single-form data). As noted earlier, the variables that showed unusually high levels of homogeneity within sample clusters were excluded from the C section variables when they were averaged. The 1977 data were used for this analysis. Later replication using 1976 data provided nearly identical values.

The averaging process consisted of taking a mean of the *square roots* of the design effects. Kish and his colleagues (1976) refer to the design effect as DEFF and to the square root of the design effect as DEFT; thus $\sqrt{\text{DEFF}}$ = DEFT. We will find it useful to use this terminology in what follows. The rationale for computing means of DEFT rather than DEFF is that the former value is directly proportionate to the size of confidence intervals. A further reason for

doing so is that the values of DEFT approximate a normal distribution much more closely than do the values of DEFF, which are skewed upwards. (A comparison of mean DEFTs and median DEFTs showed them to be quite similar, something that certainly is not true of mean and median DEFFs.)

Bearing in mind that design effects tend to be smaller for subgroups than for total samples and bearing in mind also that confidence intervals are directly proportionate to DEFT and to $\sqrt{N}$, we plotted the mean DEFT values for the total sample and for all subgroups, in each case relating DEFT to $\sqrt{N}$. The results are shown in Figure B-1. Note that distinctions are made between "cross-class" and "segregated" subgroups and between mean DEFTs based on five forms and those based on single forms. (The $\sqrt{N}$ values for the latter are, of course, much smaller.)*

Setting aside the "segregated" subgroups (regions and blacks) for the moment, it is clear that the rest of the mean DEFTs in Figure B-1 show a very clear and consistent pattern: the higher the value of $\sqrt{N}$, the higher the mean DEFT. It turns out that these mean DEFT values are very closely approximated by the function DEFT = $\sqrt{1.3+0.00015N}$, as shown by the solid line in the figure. (The function can also be stated as DEFF = 1.3 + 0.00015N.) The particular parameters in that function were derived empirically, but the basic function (i.e., DEFT = $\sqrt{a+bN}$) was adapted directly from the work of Kish et al. (1976).

Given the above function that fitted the mean DEFT values for the total sample and the "cross-class" subgroups, we returned to the problem of assigning DEFT values for the "segregated" subgroups. The simplest solution was to select two adjustment factors that could be multiplied by the confidence interval values in Table A-1. These adjustment factors are shown by the dashed lines in Figure B-1; they correspond to multiplying the "standard" DEFT (solid line) by a factor of 1.1 for single-form data and by a factor of 1.33 for five-form data. These adjustments, which were selected on empirical grounds, yield design effects for the "segregated" subgroups that are approximately equal to the design effects for the total sample (treating single-form and five-form data separately, of course). This is reassuring, since Kish et al. (1976) have reported that "segregated" subgroups can in general be expected to show design effects approximately equal to the design effects for the total sample.

After the data in Figure B-1 were plotted and the form of the main function (indicated by the solid line) was determined, DEFT values for drug use measures (material in Section B of all forms) were checked. It was found that the DEFTs for only two drug categories, alcohol and marijuana, exceeded the values indicated by the function; accordingly, adjustment factors were developed for these two drugs (1.6 and 1.35, respectively).

Confidence Intervals for Differences between Two Percentages. Our procedure here was directly parallel to that followed in determining confidence intervals for single percentages. DEFT values for the differences between 1976 and 1977 percentages were computed using virtually the same set of items as used earlier. Also computed were mean DEFT values for comparisons in the same year between subgroups such as males and females, those who did and did not plan to complete four years of college, blacks and whites, pairings of regions, and pairings of drug use groups. It was found that, for any given level of N, the mean DEFT values for subgroup comparisons were quite similar to the mean DEFT values for one-year trends; accordingly, all of these mean DEFTs were included in Figure B-2, which plots mean DEFTs for differences between percentages. In this figure, as in Figure B-1, the strong relationship was evident between mean DEFTs and the numbers of cases in the two groups being compared. This relationship can be very closely approximated by the function DEFT = $\sqrt{1.3+0.000075N}$ (which can also be stated as DEFF = 1.3 + 0.000075N), where $N = 2N_1N_2/N_1 + N_2$.

It was expected on grounds of sampling theory that, as we found earlier, the function that fit most differences between percentages would not fit differences involving regions and differences involving blacks. In fact, the data indicated that some adjustment is necessary for black–white comparisons using data from all five forms and, also, for comparisons as well as trends involving any region. We have not tried to show those adjustments in Figure B-2, but the several values involved are shown in the guidelines to Table A-2.

It was also expected on the grounds of sampling theory that trends across an interval of two or more years would show somewhat higher values of DEFT than one-year trends. It turned out that this was true only for data from all five forms; data based on one form only did not show significantly

*The five-form data consisted of C section material, excluding those variables related to region, urbanicity, and/or socioeconomic level.

Design Effects for Single Percentages

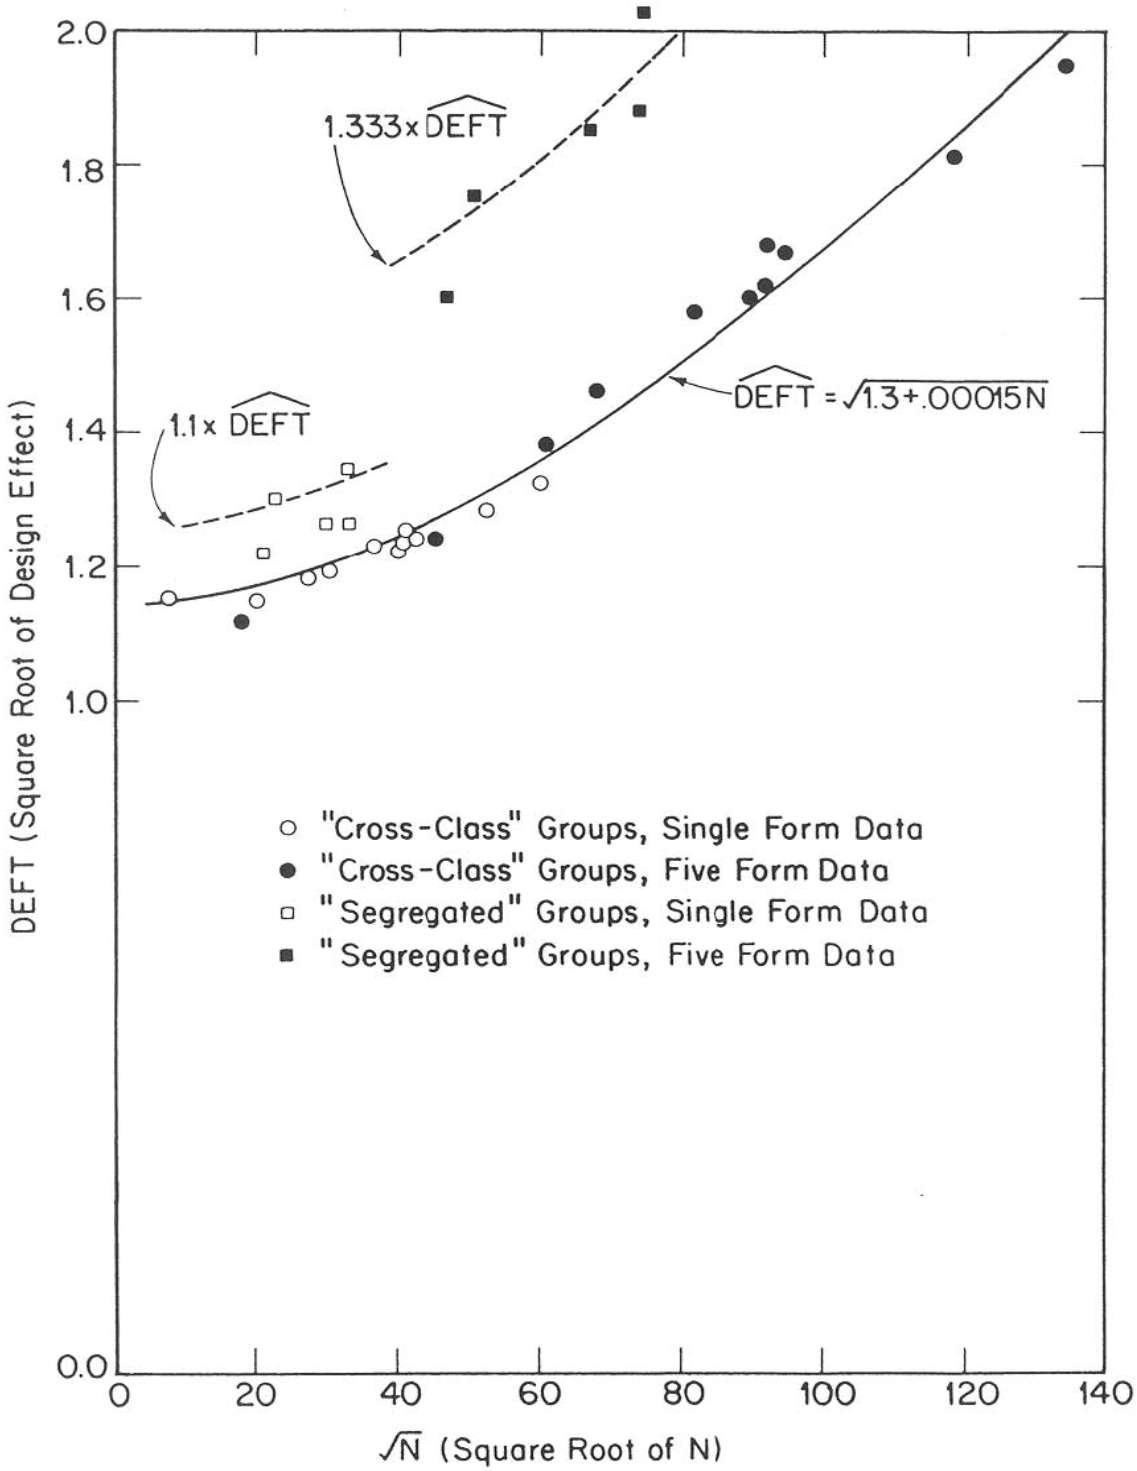

Figure B-2
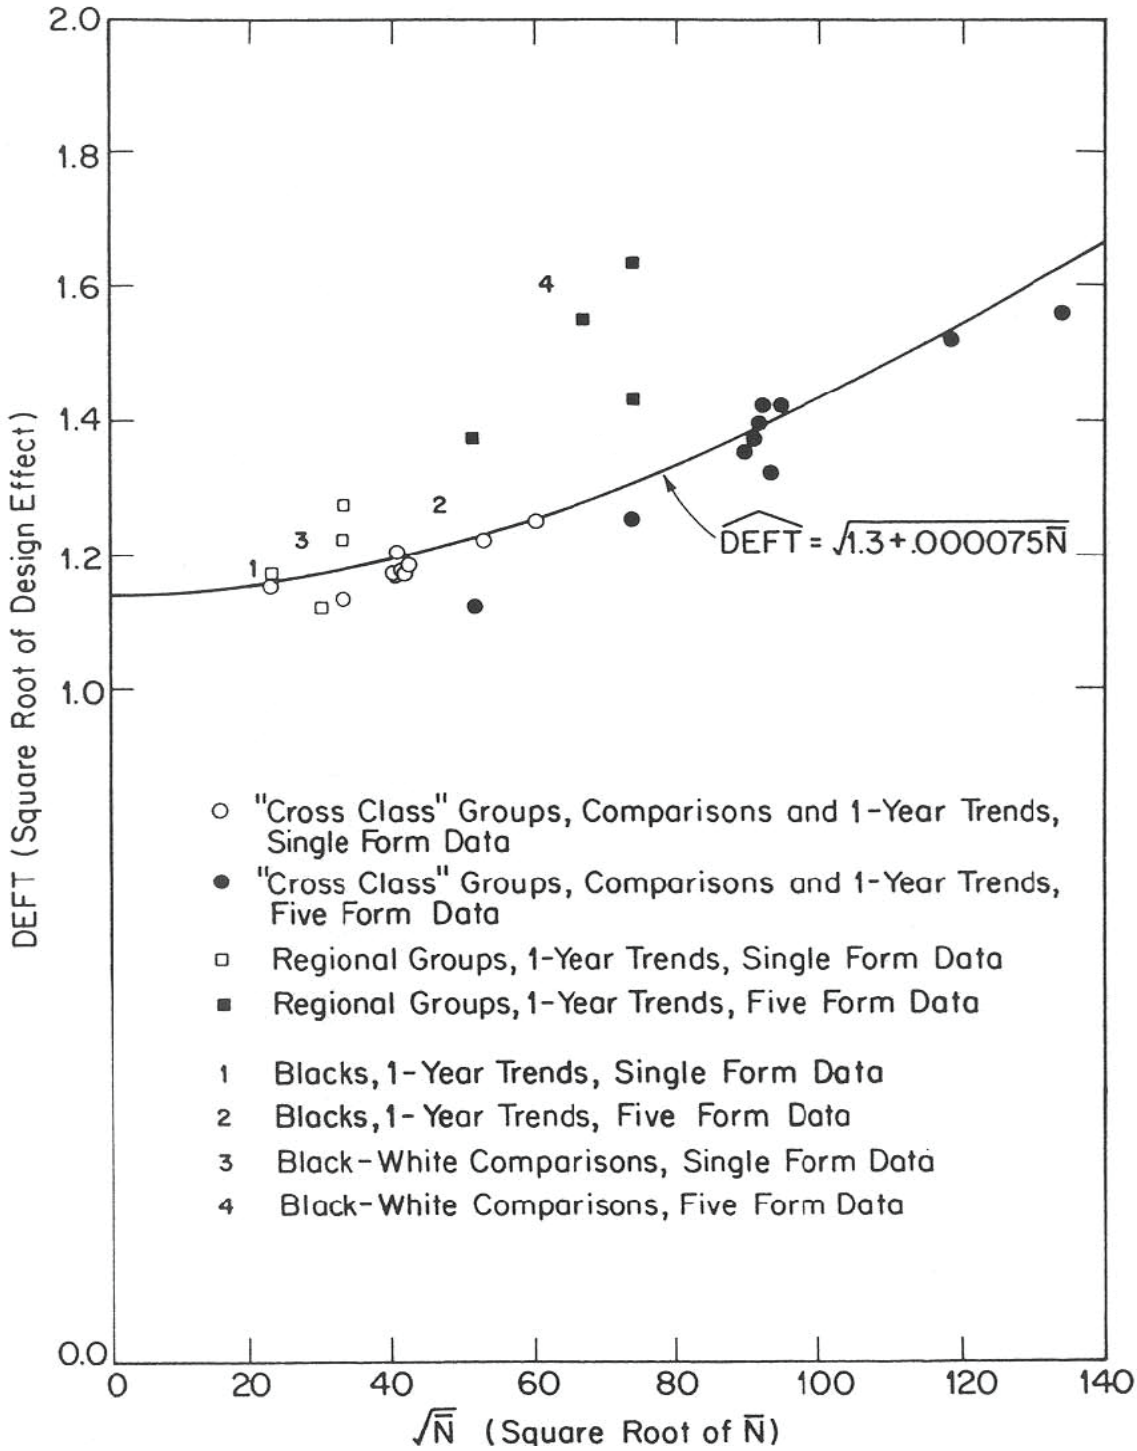
Design Effects for Differences between Percentages



higher values. The adjustment factors for trends involving five forms over two or more years are shown in Table A-2.

Use of Weighted Numbers of Cases in Entering Confidence Interval Tables. We should mention in passing that the recommendations for using the tables in Appendix A indicated that *weighted N* values should be used. The computer program that generated our design effect statistics makes use of weights in calculating percentages and actual sampling variances. But in computing the DEFF ratio, defined as the actual sampling variance divided by the expected sampling variance from a simple random sample with the same number of elements, the program makes use of the *unweighted* numbers of cases to determine "the same number of elements." Since the mean weights used in the 1975, 1976, and 1977 data tables are slightly lower than 1.0, this means that when entering the tables in Appendix A with weighted data from those years, one is being very slightly "conservative" (slightly reduced risk of a Type 1 error; slightly increased risk of a Type 2 error). It is important to realize that if one took the trouble to make corrections for this "conservatism," the correction would rarely be as great as multiplying the Table A-1 and Table A-2 entries by a factor of about 0.95; and, in the large majority of cases, the correction would involve multiplying by a factor of about 0.98. We find such discrepancies to be trivially small, particularly when compared with what Kish et al. (1976, p. 12) describe as the "heroic simplifications" required in some of the steps leading to general purpose tables of design effects and confidence intervals.

Before the 1978 data tables were produced, we had come to realize the advantages in having weighted values that averaged 1.0; accordingly, beginning with the 1978 data, the weighted *N* values in the tables do approximate the actual numbers of cases quite closely. But it was impractical to redo the 1975 through 1977 data tables to incorporate this refinement. Another alternative would have been to employ slightly different versions of Tables A-1 and A-2, containing slightly different confidence intervals for each of those three years; however, we felt that such an approach could introduce confusion when cross-year comparisons were made. Thus, we opted for the solution that seems to us to be most simple and manageable, even though it involves the slight degree of "conservatism" noted above. For readers who find this solution undesirable, we have included Table B-1, which presents weighted and unweighted *N*s for the various subgroups for each year. Table B-1 contains *N*s for all five forms (except for 1975, which shows *N*s for Forms 2 through 5). Thus, readers who wish to avoid the slight "conservatism" (and also to be more precise for subgroups in 1978 and later whose average weight is not exactly 1.0) may determine the unweighted *N*s. Some correction for missing data should be made in this case; this can be accomplished by calculating the percentage of missing data (using the weighted *N*s from the data table and the weighted *N* from Table B-1) and adjusting the unweighted *N* accordingly. These adjusted unweighted *N*s can then be used in Appendix A.

Further Applications of These Design Effects and Sampling Errors

One of the reasons for providing the above review of the factors influencing design effects and confidence intervals, and the procedures used in computing our confidence interval tables, is to provide sufficient background and data to permit the interested reader to go beyond the material provided in Appendix A. In this section we consider two specific extensions, the calculation of levels of "statistical significance" higher than 95 percent and the computation of means and their confidence intervals.

Calculating Confidence Intervals for Higher Levels of Statistical Significance. The entries contained in Tables A-1 and A-2 provide the 95 percent confidence level (also referred to as the .05 level of significance). These entries were computed by multiplying the standard error (square root of sample variance) by a factor of 1.96. The 99 percent confidence interval (.01 level of significance) uses a factor of 2.58 standard errors, and the 99.9 percent confidence interval (.001 level of significance) uses a factor of 3.29 standard errors. To convert the entries in Tables A-1 and A-2 to these higher levels, it is necessary only to multiply the entries by the appropriate constant shown below (keeping in mind that any other adjustments required in the tables must also be applied):

Confidence Interval	Significance Level	Multiply Entries by the Following:
99.0%	.01	2.58/1.96 = 1.32
99.9%	.001	3.29/1.96 = 1.68

NOTE: The sample sizes for questions on a single form are approximately one-fifth of the Ns given above for 1975-88 and one-sixth of the Ns given above for 1989 and later.

Computing Means and Their Confidence Intervals. Many of the questionnaire items included in this volume have ordinal response scales (e.g., agree, mostly agree, neither, mostly disagree, disagree), and it is often the case that a survey analyst will be willing to treat such scales as if they involved equal intervals. In such cases, means and standard deviations are more "efficient" in their use of information than are dichotomies that yield a single percentage or a pair of percentages (e.g., those who respond "agree" or "mostly agree" vs. all others). It is a relatively straightforward matter to compute means and standard deviations for the total sample or any of the subgroups treated in this volume. The problem, then, is to be able to specify confidence intervals for the means or for the differences between pairs of means. In the case of simple random samples, one needs only the means, standard deviations (or variances), and numbers of cases in order to compute confidence intervals. But in complex samples such as the present one, it is also necessary to take account of design effects. If an estimate of design effect is available, one of the simplest procedures to follow is to divide the actual numbers of cases by the design effect (thereby "depreciating" the actual number to its equivalent value in simple random sample terms) and then employ the standard statistical procedures that have been developed for application to simple random samples. Thus, for example, if the design effect (DEFF) for a sample of 18,000 were 4, then one could divide the 18,000 by 4 and the result, 4,500, could be entered as the value of "*N*" in statistical tables and formulas designed for use with simple random samples. To take another example, if one were comparing means based on two subgroups, each involving about 9,000 cases, and if the DEFF (for both subgroups) was 2, then one could compute the significance of the difference between the two means as if the *N* for each group were 4,500 (i.e., 9,000 divided by 2).

In short, the strategy involves dividing the actual number of cases by the appropriate DEFF in order to get a "simple random sampling equivalent *N*" or, more simply, an "effective *N*" for use in statistical procedures designed for random samples.

Design Effects for Use in Computing "Effective *N*s." In order to employ the strategy outlined above, one must have estimates of design effects that are judged to be appropriate for one's purposes. In the case of means based on the percentages reported in this volume, we are confident (based on personal communications with Kish) that it is appropriate to use the same DEFF values as were used in developing Tables A-1 and A-2. For other, more complex statistics, we cannot make the same assertion, although it is generally the case that design effects for such statistics are not larger than those for means and percentages (Frankel, 1971; Kish and Frankel, 1970).

In Table B-2 we provide guidelines for computing DEFF values for single percentages (or means) and for differences between two percentages (or means). For reasons discussed elsewhere in this appendix, we must provide for different (and somewhat higher) DEFFs for "segregated" subgroups (regional subgroups and sometimes also blacks) and for trends over two or more years (in contrast to one-year trends). And in all instances, of course, the DEFF values are very much influenced by the average size of sampling clusters, which is always dependent on the number of cases (*N*). Accordingly, all of the design effect formulas in Table B-2 require computations that take account of *N*. (It should also be noted that the formulas in Table B-2 correspond exactly to the values of design effects and adjustment factors used in Tables A-1 and A-2 in Appendix A.)

A Concluding Note. In their very useful paper dealing with sampling errors for fertility surveys, Kish et al. (1976) commented that some of the methods they used "emerged after several false starts." They went on to say that the volume and diversity of the data they were dealing with "presented new challenges and opportunities." And they added, "Our methods are subject to further developments and modifications, and we invite participation and suggestions" (p. 10). Our own attempts to apply the methods of Kish and his colleagues to the data reported in this volume have been challenged by the diversity of the data, have involved several false starts, and, we hope, are subject to further developments and modifications. We invite readers to offer their suggestions, and we also encourage readers to inquire about further work that we and/or others may carry out during the coming months and years.

Table B-2
Guidelines for Computing Design Effects (DEFFs) for Percentages and Means Derived from Monitoring the Future Samples

Definitions

DEFF (design effect) = $\frac{\text{estimated sampling variance}}{\text{expected sampling variance from simple random sample with same number of elements}}$

N = number of respondents on whom a single percentage or mean is based

$\overline{N} = 2N_1N_2/(N_1 + N_2)$, for use in comparisons of two percentages or means, based on two groups of *sizes* N_1 and N_2

Design Effect Formulas

1. For single percentages or means involving . . .	
a. Regional subgroups or blacks	
DEFF for single-form data	$(1.3 + 0.00015N)(1.21)$
DEFF for five-form data	$(1.3 + 0.00015N)(1.78)$
b. All other subgroups or total sample	
DEFF for single-form or five-form data	$1.3 + 0.00015N$
2. For comparisons between . . .	
a. Any two regions	
DEFF for single-form data	$(1.3 + 0.000075\overline{N})(1.32)$
DEFF for five-form data	$(1.3 + 0.000075\overline{N})(2.25)$
b. Blacks and whites	
DEFF for single-form data	$1.3 + 0.000075\overline{N}$
DEFF for five-form data	$(1.3 + 0.000075\overline{N})(1.56)$
c. Genders, college plans groups, or any two "drug use" subgroups	
DEFF for single-form or five-form data	$1.3 + 0.000075\overline{N}$
3. For one-year trends involving . . .	
a. Any region	
DEFF for single-form data	$1.3 + 0.000075\overline{N}$
DEFF for five-form data	$(1.3 + 0.000075\overline{N})(1.56)$
b. All other subgroups or total sample	
DEFF for single-form or five-form data	$1.3 + 0.000075\overline{N}$
4. For trends over two or more years involving . . .	
a. Any region	
DEFF for single-form data	$1.3 + 0.000075\overline{N}$
DEFF for five-form data	$(1.3 + 0.000075\overline{N})(1.82)$
b. All other subgroups or total sample	
DEFF for single-form data	$1.3 + 0.000075\overline{N}$
DEFF for five-form data	$(1.3 + 0.000075\overline{N})(1.32)$

Appendix C
Questionnaire Covers, Instructions, and Sample Page

monitoring the future

a continuing study of American youth

This questionnaire is part of a nationwide study of high school seniors, conducted each year by the University of Michigan's Institute for Social Research. The questions ank your opinions about a number of things--the way things are now and the way you think they ought to be in the future. In a sense, many of your answers on the questionnaire will count as "votes" on a wide range of important issues.

If this study is to be helpful, it is important that you answer each question as thoughtfully and frankly as possible. All your answers will be kept strictly confidental, and will never been seen by anyone who knows you.

This study is completely voluntary. If there is any question that you or your parents would find objectionable for any reason, just leave it blank.

In a few months, we would like to mail each of you a summary of the nationwide results from the study. Also, in about a year we would like to mail another questionnaire to some of you, asking how your plans have worked out and what's happening in your lives.

In order to include you in the mailings, we ask for your name and address on a special form at the end of this questionnaire. This form is to be torn out and handed in separately. Once the address form and the questionnaire have been separated, there is no way they can be matched again, except by using a special computer tap at the University of Michigan. The only purpose for that tape is to match a follow-up questionnaire with this one.

Other seniors have said that these questionnaires are very interesting and that they enjoy filling them out. We hope you will too. Be sure to read the instructions on the other side of this cover page before you begin to answer. Thank you very much for being an important part of this project.

INSTITUTE FOR SOCIAL RESEARCH
THE UNIVERSITY OF MICHIGAN
ANN ARBOR, MICHIGAN

INSTRUCTIONS

1. **This is not a test, so there are no right or wrong answers; we would like you to work fairly quickly, so that you can finish.**

2. **All of the questions should be answered by marking one of the answer spaces. If you don't always find an answer that fits exactly, use the one that comes closest. If any question does not apply to you, or you are not sure of what it means, just leave it blank.**

3. **Your answers will be read automatically by a machine called an optical mark reader. Please follow these instructions carefully:**

   - **Use only the black lead pencil you have been given**
   - **Make heavy black marks inside the circles.**
   - **Erase cleanly any answer you wish to change.**
   - **Make no other markings or comments on the answer pages, since they interfere with the automatic reading. (If you want to add a comment about any question, please use the space provided below.)**

These kinds of markings will work:

These kinds of markings will NOT work:

(THIS SPACE FOR WRITTEN COMMENTS)

WHY YOUR NAME AND ADDRESS?

As we told you earlier, we'd like to send you a summary of the nationwide results of the present study, and in about a year we want to mail a shorter questionnaire to some of you. In order to include you in these follow-ups, we would like to have an address where information will be sure to reach you during the coming year.

HOW IS CONFIDENTIALITY PROTECTED?

- The information on this page will be used ONLY for mailing, and will always be kept separate from your answers. A special Grant of Confidentiality from the U.S. government protects all information gathered in the research project.
- The questionnaire and address pages will be collected separately, sealed immediately in separate envelopes, and sent to two different sites for processing.
- Once a questionnaire and address page have been separated, there is no way they can be matched, except by using a special computer tape at the University of Michigan. That tape contains the two DIFFERENT numbers that appear on the back of this questionnaire. These numbers will be used ONLY to match a follow-up questionnaire with this one.

Before filling out this address page, please separate it from the rest of the questionnaire by FOLDING ALONG THE PERFORATED LINE AND TEARING CAREFULLY.

Please PRINT you name and the address where you can most likely be reached during the coming year.

Mr.
Miss_____
Ms. FIRST NAME INITIAL LAST NAME
Mrs.

STREET_____

CITY_____

STATE_____

TELEPHONE NO. ( ) -_____
AREA

In case we should have trouble getting mail to you, if you move, please PRINT the name and address of one other person (with a different address than your own) who will know where to reach you in the futute. (Examples of such a person: aunt or uncle, older sister or brother, or clsoe friend.)

Mr.
Miss_____
Ms. FIRST NAME INITIAL LAST NAME
Mrs.

STREET_____

CITY_____

STATE_____

AREA

THANK YOU AGAIN FOR YOUR HELP

PART A

*** BEFORE BEGINNING BE SURE YOU HAVE READ THE INSTRUCTIONS ON THE COVER.**

1. Taking all things together, how would you say things are these days—would you say you're very happy, pretty happy, or not too happy these days?

③ Very happy
② Pretty happy
① Not too happy

2. Some people think a lot about the social problems of the nation and the world, and about how they might be solved. Others spend little time thinking about these issues. How much do you think about such things?

① Never
② Seldom
③ Sometimes
④ Quite often
⑤ A great deal

3. Of all the problems facing the nation today, how often do you worry about each of the following? (Mark one circle for each line.)

	Never	Seldom	Sometimes	Often
a. Chance of nuclear war	①	②	③	④
b. Population growth	①	②	③	④
c. Crime and violence	①	②	③	④
d. Pollution	①	②	③	④
e. Energy shortages	①	②	③	④
f. Race relations	①	②	③	④
g. Hunger and poverty	①	②	③	④
h. Using open land for housing or industry	①	②	③	④
i. Urban decay	①	②	③	④
j. Economic problems	①	②	③	④
k. Drug abuse	①	②	③	④

4. How well do you think your experiences and training (at home, school, work, etc.) have prepared you to be a good...

	Poorly	Not So Well	Fairly Well	Well	Very Well
a. ...husband or wife?	①	②	③	④	⑤
b. ...parent?	①	②	③	④	⑤
c. ...worker on a job?	①	②	③	④	⑤

5. Apart from the particular kind of work you want to do, how would you rate each of the following settings as a place to work? (Mark one circle for each line.)

	Not At All Acceptable	Somewhat Acceptable	Acceptable	Desirable
a. Working in a large corporation	①	②	③	④
b. Working in a small business	①	②	③	④
c. Working in a government agency	①	②	③	④
d. Working in the military service	①	②	③	④
e. Working in a school or university	①	②	③	④
f. Working in a police department or police agency	①	②	③	④
g. Working in a social service organization	①	②	③	④
h. Working with a small group of partners	①	②	③	④
i. Working on your own (self-employed)	①	②	③	④

6. If you were to get enough money to live as comfortably as you'd like for the rest of your life, would you want to work?

① I would want to work
② I would not want to work
